CHAPTER 1

UNIQUE EDIT/VALIDATION CRITERIA

11.1 TITLE - EXCEPTION CRITERIA AND UNIQUE EDITS FOR FIXED AND VARIABLE FORMATS

Data elements are not necessarily in the same sequence for both variable and fixed formats. Transaction Managment will reformat external formats to a common internal variable format. Exceptions to recognizing, and processing variable and fixed formats are listed below. The specific edits and validations done on common fixed and variable format headers are listed in Chapter 2. All transactions that reject from Transaction Management do so under output DIC KRU. See volume 8 for the Input/Output fixed length formats. See volume 9 for the Input/Output variable length formats.

Variable format Input/Output transactions always begin with a numeric 4 position segment length. The package sequence number for the first record is always “A01” because variable transactions have a minimum of two records. The header record will only be repeated (using same dcn) for DIC LMX, the nsn will change on each full header. Mini-Headers will be used under DIC LMD to indicate multiple actions that must be processed together. Character/data element occurs counters are required for some data elements in variable format.

Following are examples of variable format transactions:

Fixed format input/output transactions contain header data in columns 1-40 of every record. All fixed format transactions begin with a three position DIC in columns 1-3. Fixed format records also contain a Continuation Indicator Code (CIC) in column 80. The CIC is used to determine the end, or last, record of the segment. Edits are done to ensure the submitted DIC, Segment Code, and CIC are valid combinations. The crosshatch symbol (#) is used to indicate the end of a variable length data element (as in segments “R” and “V”). No fixed format input will contain separate header records except DIC’s LMD and LMX. Position 40 contains the segment code. This will be blank for the LMD and LMX header. Subsequent records will contain the appropriate segment code. Fixed format can accommodate some single record transactions. In this case the PSN will be “Z01”. All other multiple record transactions will begin with “A01” and will be consecutively numbered. The last record will contain a PSN beginning with “Z”.

Special edits are done on message level input to FLIS. The Input Message Processing System (IMPS) performs edits on every character. Volume 2,, appendix 2-3-A lists the characters that can be exchanged with FLIS. IMPS validates and rejects messages that are duplicates (same message header received within 24 hours). Variable message data is checked. IMPS calculates the segment lengths and will reject the message if an invalid length is encountered. IMPS also validates the message length in the trailer-if invalid, message is rejected. The COMMRI in the message header is validated-if invalid, message is rejected. IMPS also validates pilot headers and content indicator codes. imps will reject the entire message back to the commri if any of the above error conditions are detected. None of the transactions will be released to Transaction Management for FLIS processing. The submitting activity must correct their data errors and retransmit the message data back to Logistics Information Services. Message level rejects are sent in the form of a service message, these are exchanged between communication centers.

Exception processing is done for NATO/FG traffic. Logistics Information Services will accept K-DIC transactions as input as long as the COMMRI activity code begins with W, Y, OR Z. (bypasses the HV edit). For tape/cartridge/disk media, if a K-DIC is submitted then the NCB code must be greater than 10. Special processing is done to handle KRU output for NATO. All KRU's resulting from a NATO/FG submitted L-DIC will be returned to the submitter and a copy will be logged to manage by DIC to be released to the NCC system. All KRU's on K-DIC input will only be returned to activity 9Z. This special KRU package will also carry an image of the original K-DIC input transaction. These KRU's do not get logged to the NCC.

For NATO submitted transactions, TM will move the value of the submitting activity code, related transaction, to the front of the document control number (in front of the originator code).
