COMPLETION OF SENIOR TECHNICAL REVIEW

This document has been produced within the framework of the ERT, Inc. (ERT) quality management system. As such, a senior technical review has been conducted. This included review of all elements addressed within the document, proposed or utilized technologies and alternatives and their applications with respect to project objectives and framework of U.S. Army Corps of Engineers regulatory constraints under the current project, within which this work has been completed.

COMPLETION OF INDEPENDENT TECHNICAL REVIEW

This document has been produced within the framework of ERT's quality management system. As such, an independent technical review, appropriate to the level of risk and complexity inherent in the project, has been conducted. This included a review of assumptions; alternatives evaluated; the appropriateness of data used and level of data obtained; and reasonableness of the results, including whether the product meets the project objectives. Comments and concerns resulting from review of the document have been addressed and corrected, as necessary.

GLOSSARY OF TERMS

Defense Site – All locations that are or were owned by, leased to, or otherwise possessed or used by the Department of Defense (DoD). The term does not include any operational range, operating storage or manufacturing facility, or facility that is used or was permitted for the treatment or disposal of military munitions.

Decision Unit (DU) – the smallest volume of soil (or other media) for which a decision will be made based upon Incremental Sampling Methodology sampling. A DU may consist of one or more sampling units.

Incremental Sampling Methodology (ISM) – ISM is a structured composite sampling and processing protocol that reduces data variability and provides a reasonably unbiased estimate of mean contaminant concentrations in a volume of soil targeted for sampling. ISM provides representative samples of specific soil volumes defined as decision units (DUs) by collecting numerous increments of soil that are combined, processed, and subsampled according to specific protocols.

Sampling Unit (SU) – An SU is a volume of soil from which increments are collected to determine an estimate of the mean concentration for that volume.

U.S. EPA Region III Biological Technical Assistance Group – A USEPA Region III group of scientists to advise and assist site managers with ecological studies produced in conjunction with Remedial Investigations and Feasibility Studies (RI/FSs) and Removal Actions at Superfund sites. In general, these groups are known as Biological Technical Assistance Groups or BTAGs.

EXECUTIVE SUMMARY

INTRODUCTION AND SCOPE

ERT, Inc., has been contracted to perform a site-wide Remedial Investigation (RI) and Feasibility Study (FS) at the Former Curtis Bay Ordnance Depot, Curtis Bay, Maryland, (herein after referred to as "the Depot") focusing on depot-wide arsenic and manganese potential contamination under U.S. Army Corps of Engineers (USACE) Baltimore District (CENAB) contract [redacted] Delivery Order [redacted]

This RI Report describes the procedures, methods, organization, and resources that ERT used to achieve the project objectives described in the Performance Work Statement dated 11 March 2016, the Modifications of Contract dated 6 February 2019 and 26 August 2020, the Final Uniform Federal Policy for Quality Assurance Project Plan (UFP-QAPP)/Work Plan (ERT, 2019), and modifications to the UFP-QAPP as identified in the Maryland Department of the Environment (MDE) comments on the Draft Final RI Report. The overall purpose of this RI was to determine whether further response actions are necessary for arsenic and/or manganese in soil under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Military Munitions Response Program (MMRP) processes. The objectives of the RI were to:

- Determine if arsenic and/or manganese concentrations in surface (0-1 foot [ft] bgs) and/or subsurface (1-2 ft bgs) soil pose a potential unacceptable risk to human health and/or the environment;
- Determine site-specific background arsenic and manganese concentrations in surface (0-1 ft bgs) and subsurface (1-2 ft bgs) soil; and
- Refine the Conceptual Site Model (CSM), as necessary.

This RI did not include investigations of unexploded ordnance or the associated munitions constituents and is focused only on the impacts to site soil from arsenic and manganese. Investigation of munitions and explosives of concern and associated munitions constituent sampling were conducted during previous investigations.

PROPERTY DESCRIPTION AND HISTORICAL INFORMATION

The Depot is located in Anne Arundel County, Curtis Bay, Maryland, approximately one mile southeast of Baltimore, Maryland. Through various property transfers, the Depot now covers approximately 435 acres and is bordered on the east by Curtis Creek and on the south by Furnace Creek (Appendix A, Figure 1).

The original U.S. Army Ordnance Depot was built in 1918 on 789 acres of farmland and became fully operational in 1920. Additional acreage was acquired, increasing the total area to 815 acres. Approximately 37 acres were reassigned to the U.S. Army Reserve in 1958 and 1966. Following several land transfers to Anne Arundel County and the Maryland Department of Transportation (DOT), the remaining 435 acres were transferred to the General Services Administration (GSA)

as excess property in the late 1950s. A map of the existing property (435 acres) is shown in Appendix A, Figure 2.

All historical Depot activities within the investigation area that may have contributed to arsenic and manganese are not known. Pesticide/herbicides were reportedly used at the Depot around the railroad tracks, buildings, and ore stockpiles (Parsons, 1999). However, the Depot was built on farmland (Parsons, 1999) and pesticides/herbicides were likely used. Stockpiles of raw ores, some of which contained arsenic and/or manganese were stored throughout the Depot (Parsons, 1999). Arsenic and manganese also occur under natural conditions as a result of both chemical and physical weathering process on parent rock. Therefore, the known potential contributors to arsenic and manganese in soil include:

- Ore stockpiles (arsenic and manganese);
- Anthropogenic sources (pesticide/herbicide use [arsenic], atmospheric deposition [arsenic and manganese]); and
- Natural sources.

INVESTIGATION AREAS FOR THE RI

ERT investigated arsenic and manganese impacts within the boundaries of the Depot that are currently owned by the GSA and managed by the Defense Logistics Agency (DLA), except for the area that is undergoing a Non-Time Critical Removal Action (NTCRA), as shown in Appendix A, Figure 2. The investigation area for this RI is approximately 425 acres and does not include the Anne Arundel County Facility or U.S. Army Reserve Dock, which are not owned by GSA.

The Decision Units (DUs) for arsenic and manganese in soil were based on previous RI soil analytical data for arsenic and/or manganese, primarily in surface soil, where concentrations were greater than the previous investigation PSLs.

Previous soil sample analyses indicate:

- arsenic is present in the DU 2 soil at elevated concentrations;
- manganese is present in the DU 3 soil at elevated concentrations; and
- arsenic and manganese are present in the remaining area of the Depot (DU 1) soil at elevated concentrations in various locations with no discernable clusters.

INVESTIGATION ACTIVITIES

ERT collected all soil samples using the Incremental Sampling Methodology (ISM). Based on the approved UFP-QAPP (ERT, 2018) sampling units (SUs) for this investigation were approximately 150 ft x 150 ft (approximately 0.52 acres), or less. Thirty increments were collected from each sampling unit (SU), irrespective of the size of the SU.

The RI sampling program included:

- 87 (59 in DU 1A, 18 in DU 2A, and 10 in DU 3A) incremental sampling (IS) surface soil samples (0-1 ft below ground surface [bgs]);
- 87 IS (59 in DU 1B, 18 in DU 2B, and 10 in DU 3B) subsurface soil samples (1-2 ft bgs); and

- 7 IS surface (DU 4A) and 7 subsurface (DU 4B) background soil samples (0-1 ft bgs and 1-2 ft bgs, respectively).

All samples were submitted for laboratory analysis of arsenic and manganese. The analytical data obtained during the RI were deemed valid and usable for project decision making.

RI FINDINGS

Site-wide (the combined areas of DU 1, DU 2, and DU 3), arsenic was reported in 85 of 87 surface soil SUs and in 83 of 87 subsurface soil SUs at concentrations greater than the U.S. Environmental Protection Agency (USEPA) Regional Screening Level (RSL) for residential soil (0.68 mg/kg). Site-wide, arsenic was reported in 82 of 87 surface soil site SUs and in 75 of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for industrial soil (3.0 mg/kg). Site-wide, arsenic was reported in 61 of 87 surface soil site SUs and in 49 of 87 subsurface soil site SUs at concentrations greater than the background threshold value (BTV [7.8 mg/kg]). Site-wide, no reported results for arsenic were greater than the Biological Technical Assistance Group (BTAG) screening level for arsenic (330 mg/kg).

Site-wide, manganese was reported in 43 of 87 surface soil site SUs and in 18 of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for residential soil (300 mg/kg). Site-wide, manganese was reported in ten of 87 surface soil site SUs and in two of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for industrial soil (13,000 mg/kg). Site-wide, manganese was reported in 60 of 87 surface soil SUs and 35 of 87 subsurface soil SUs at concentrations greater than the BTV (460.5 mg/kg). Site-wide, manganese was reported in 69 of 87 surface soil SUs and 50 of 87 subsurface soil SUs at concentrations greater than the BTAG screening level (330 mg/kg).

Sampling results were greater than the human health and/or ecological screening levels for arsenic and manganese at all three DUs. There were sufficient data to evaluate the risks to human health and to the environment, and as part of this RI, ERT conducted an HHRA and SLERA to quantify the risks.

HUMAN HEALTH RISK ASSESSMENT SUMMARY

The HHRA quantitatively evaluated the risks to human health for the resident child, resident adult, site worker, and construction worker. Although it is unlikely that the site will be developed for residential use in the future, this evaluation included a potential future use of the land as residential to provide protective future risk estimates. For the future residential child, site soil impacts due to arsenic and/or manganese in all three DUs may result in non-cancer hazard and/or cancer risk above the acceptable values. For the future residential adult, site soil impacts due to arsenic and/or manganese at DU 2 and DU 3 may result in non-cancer hazard and/or cancer risk above the acceptable values. For the current/future site worker and future construction worker, exposure to soil may result in non-cancer hazard risk above the acceptable value due to dermal exposure to manganese in soil. Table ES-1 summarizes the conclusions of the HHRA for each DU at the Depot.

Table ES-1. HHRA Conclusions for the Former Curtis Bay Depot Arsenic and Manganese RI

Decision Unit	DU 1	DU 2	DU 3
Future Resident Child	**Unacceptable Non-Carcinogenic Risks Due to Manganese**	**Unacceptable Carcinogenic Risks Due to Arsenic** **Unacceptable Non-Carcinogenic Risk Due to Manganese**	**Unacceptable Carcinogenic Risks Due to Arsenic** **Unacceptable Non-Carcinogenic Risk Due to Manganese**
Future Resident Adult	No Risks Identified	**Unacceptable Carcinogenic Risks Due to Arsenic**	**Unacceptable Non-Carcinogenic Risk Due to Manganese**
Current and Future Site Workers	No Risks Identified	No Risks Identified	**Unacceptable Non-Carcinogenic Risk Due to Manganese**
Current and Future Construction Workers	No Risks Identified	No Risks Identified	**Unacceptable Non-Carcinogenic Risk Due to Manganese**

Legend:
Bold text indicates unacceptable human health risks. (i.e., Carcinogenic Risks > 10^{-5}; Non-carcinogenic HI > 1)

SCREENING-LEVEL ECOLOGICAL RISK ASSESSMENT

Although the Depot is not a managed ecological site and will likely be used as an industrial (based on current zoning) site, ERT conducted a SLERA in accordance with USEPA guidance for each site DU. Based on the results of the SLERA for the Depot, significant ecological impacts due to the presence of arsenic in soils at all three DU sites are unlikely.

Based on the results of the SLERA for the Depot, potentially significant ecological impacts due to the presence of manganese exist at DU 3. Table ES-2 summarizes the conclusions of the SLERA for each DU at the Depot.

Table ES-2. SLERA Conclusions for the Former Curtis Bay Depot Arsenic and Manganese RI

Decision Unit	DU 1	DU 2	DU 3
SLERA HQ Arsenic*	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely
SLERA HQ Manganese*	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely	**Ecological Impacts are Likely**

Legend:
* *Based on the 95% Upper Confidence Limit of the mean.*
HQ Hazard Quotient

Due to ecological risks identified in the SLERA, ERT conducted uptake modeling of ecological risk due to arsenic and manganese in Depot soil (Step 3A of the 8-step ecological risk assessment).

Uptake modeling evaluated the arsenic and manganese ingestion modeling for two animal receptor species known to occur on-site and which are known to be sensitive to the chemicals in question: the white-footed mouse and the mourning dove. Results of the Step 3A modeling confirmed the SLERA conclusions for arsenic and manganese.

Although the overall ecological risk in DU 1 and DU 2 are unlikely, review of individual SU sampling data for DUs 1 and 2 reveal an apparent pattern of significantly elevated concentrations of manganese in soil in the southwestern-most 2 SUs of DU 2 (SU11A and SU12A) and 3 adjacent SUs of DU 1 (SU12A/B, SU15A, and SU18A). It is recommended that this area be evaluated in the FS for remedial action to protect ecological receptors in the vicinity of these SUs.

There are additional DU 1 SUs (SU23A, SU24A, and SU37A/B) where manganese concentrations in soil may adversely impact ecological receptors. It is recommended that these DU 1 SUs be evaluated in the FS for remedial action to protect ecological receptors.

CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the HHRA, potential unacceptable risks to residential child and/or adult receptors due to arsenic and/or manganese concentrations in surface and subsurface soil exist in all three site DUs and potential unacceptable risk to site workers and construction workers due primarily to manganese concentrations in surface and subsurface soil exists in DU 3. Based on the results of the SLERA, potential unacceptable risks to the environment due to manganese concentrations in surface and subsurface soil exists in DU 3 and in individual SUs in DU 1 and DU 2. Therefore, further environmental management decisions should be considered at the Depot to mitigate potential unacceptable risks resulting from arsenic and manganese concentrations in site soil. An FS is recommended to evaluate remedial alternatives that adequately address the potential unacceptable risks to human health and the environment from arsenic and manganese in the Depot soil.

1.0 INTRODUCTION

ERT, Inc., has been contracted to complete a site-wide Remedial Investigation (RI) and Feasibility Study (FS) focusing on depot-wide arsenic and manganese potential contamination at the Former Curtis Bay Ordnance Depot, Curtis Bay, Maryland, (herein after referred to as "the Depot") under U.S. Army Corps of Engineers (USACE) Baltimore District (CENAB) contract [redacted] Delivery Order [redacted]

All work was performed in consideration of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) [42 USC 9601 et seq.], the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR 300), and applicable DoD policies.

This RI Report describes in detail the procedures, methods, organization, and resources that ERT used to achieve the project objectives described in the Performance Work Statement dated 11 March 2016, the Modification of Contract dated 6 February 2019, and the Final Uniform Federal Policy for Quality Assurance Project Plans (UFP-QAPP)/Work Plan (ERT, 2019).

1.1 Purpose and Scope

The overall purpose of this RI is to determine whether further response actions are necessary under the CERCLA, Military Munitions Response Program (MMRP), and Installation Restoration Program (IRP) processes.

Historical data indicate that locations within the investigation area contain arsenic and/or manganese, primarily in surface soil, at elevated concentrations. Previous soil sampling data indicated a release of arsenic to surface soil at Decision Unit (DU) 2 (formerly known as the IRP Shop Area) and a release of manganese to surface soil in DU 3 (formerly known as the Environmental Concern [EC]-57D area, an MMRP site). Previous soil sampling data within the remaining investigation area (DU 1) indicated a potential release of arsenic and/or manganese to surface soil, but the data were not sufficient to determine if the potential releases represented a potentially unacceptable risk to human health and/or the environment. Therefore, additional investigation activities are being completed during this effort to determine if elevated concentrations of arsenic and manganese in surface and subsurface soil throughout the investigation area (DU 1, DU 2, and DU 3) pose a potential unacceptable risk to human health and/or the environment.

The objectives of the RI are to:

1. Determine if arsenic and/or manganese concentrations in surface (0-1 foot [ft] below ground surface [bgs]) and/or subsurface (1-2 ft bgs) soil pose a potential unacceptable risk to human health and/or the environment;
2. Determine site-specific background arsenic and manganese concentrations in surface (0-1 ft bgs) and subsurface (1-2 ft bgs) soil; and
3. Refine the Conceptual Site Model (CSM), as necessary.

This RI does not include investigations of unexploded ordnance or the associated munitions constituents and is focuses only on the impacts to site soil from arsenic and manganese. Investigation of munitions and explosives of concern and associated munitions constituent sampling were conducted during previous investigations.

1.2 Property Description

The Depot is located in Anne Arundel County, Curtis Bay, Maryland, approximately one mile southeast of Baltimore, Maryland. Through various property transfers, the Depot now covers approximately 435 acres and is bordered on the east by Curtis Creek and on the south by Furnace Creek (Appendix A, Figure 1).

1.3 Former Curtis Bay Ordnance Depot Historical Information

The original U.S. Army Ordnance Depot was built in 1918 on 789 acres of farmland and became fully operational in 1920. Additional acreage was acquired, increasing the total area to 815 acres. Approximately 37 acres were reassigned to the U.S. Army Reserve in 1958 and 1966. Following several land transfers to Anne Arundel County and the Maryland Department of Transportation (DOT), the remaining 435 acres was transferred to the General Services Administration (GSA) as excess property in the late 1950s. A map of the existing property (435 acres) is shown in Appendix A, Figure 2.

The former U.S. Army Ordnance Depot's mission, from approximately the 1920s through the 1950s, included receipt, storage, maintenance, and demilitarization of ammunition of domestic and overseas supplies. During this time, the property was designated as the Curtis Bay Ordnance Depot. Among the original facilities constructed in 1918 were docks, pump houses, 33 standard magazines, eight standard high explosive magazines, 57 smokeless magazines, nine fuze and primer magazines, barracks, mess halls, a medical building, an engine house, a machine shop, a repacking house, a guard house, a fire engine house, and two general warehouses. Ordnance-related operations at the Depot included a renovation plant which transferred 75-millimeter (mm) shrapnel to metal containers (Green, n.d.).

A 1928 fire within a smokeless powder magazine that contained 630,000 pounds of 9.2 howitzer powder and the ensuing public protest prompted the removal of 155mm high explosive ammunition from the Curtis Bay Ordnance Depot to the Savanna Illinois Ordnance Depot. The remaining high explosive ammunition stored at the Depot consisted of 75mm shells (Green, n.d.). In 1932, bonderizing plant operations began in a section of Building 1022. Operations at the bonderizing plant included the breakdown of 75mm shrapnel, inspection of the powder, and re-priming. From 1938 to 1942, a different section of Building 1022 was used as a bag loading plant for manufacturing propelling charges for 155mm howitzers and guns (Green, n.d.).

Facilities at the Depot underwent renovations and rehabilitation, primarily through the Works Progress Administration between 1939 and 1940. The function of the Depot then evolved in 1942 to include its use as a small arms packing plant, a transshipment depot for Hawkins Point Pier, and

facility for personnel training, particularly in bag loading. Operations at the small arms packing plant began in 1951 and included belting, linking, and clipping .30- and .50-caliber cartridges.

Following World War II and the Korean War, the Depot's mission involved sorting, processing and decommissioning munitions returning from overseas. This operation was known as Operation Brass and Steel (Miduski, circa 1952-1953 and Green, n.d.). An ammunition-popping plant located in Warehouse 1022 was built in the 1950s. The operations in the ammunition popping plant included disarming and dismantling small brass ammunition returning from overseas (Miduski, circa 1952-1953).

The Depot's mission once again evolved in the 1950s to include: the inspection, maintenance, and storage of small arms ammunition, inert ammunition, ammunition packing materials and smokeless powder (Class 2 only); the demilitarization of unsafe and surplus small arms ammunition, components, and smokeless powder; the storage of general supplies; the receipt, inspection, demilitarization, and shipment of mixed metals, such as fired artillery shells, containers, brass, and projectile plugs; the winterization of equipment; and the receipt and storage of ore for the GSA (Miduski, circa 1952-1953).

In 1952, GSA delegated a new strategic and critical materials stockpile program to its own newly established Emergency Procurement Service. A portion of the Curtis Bay Ordnance Depot was set aside for the storage of GSA strategic and critical materials by the Emergency Procurement Service.

Munitions related activities at the Curtis Bay Ordnance Depot were placed on inactive status in 1958, except for the strategic and critical materials activity. In 1958, the 435.46 acres of the Depot, including the critical materials storage area, were transferred from the DoD to GSA as excess property.

Between 1949 and 1988, responsibility for the storage of strategic and critical materials was the responsibility of the GSA and the Federal Emergency Management Agency. This responsibility was transferred to the Secretary of Defense and assigned to the Defense Logistics Agency (DLA) in 1988. In 1992, the DLA established the Defense National Stockpile Center (DNSC) to manage the stockpile program. The DNSC ceased stockpile operations in 2005 and no longer conducts operations at the Depot; all stockpiles have been removed from the Depot.

The GSA owns the land currently occupied by the Depot. The Depot was declared as excess property in 2005. GSA delegated the responsibilities for environmental investigations and possible remedial actions to the DLA, who acts as executor for the GSA for the Depot environmental activities. The dock area of Curtis Creek is owned and controlled by the U.S. Army Reserve and lies outside the project area. There are currently no active uses of the areas of the Depot owned by GSA.

1.4 Previous Former Curtis Bay Ordnance Depot Investigations

Numerous historical investigations have occurred at the Depot. Although many historical reports exist, only those reports directly relevant to the purposes of this RI are detailed below.

1.4.1 Focused Site Investigation (FSI) and Final Expanded SI (ESI), Parsons

Parsons conducted an FSI at the Depot in 1999 to determine whether hazardous substances had been released in the environment by the Depot's ore stockpiles, and, if a released had occurred, to determine the likelihood that the hazardous substances had migrated off-site and impacted human or environmental receptors (Parsons, 2000). During the FSI and ESI, Parsons collected soil, sediment, groundwater, and surface water samples from four areas of concern (AOCs). The AOCs were focused on the ore stockpiles.

The objective of the environmental sampling is to determine whether specific media contained concentrations of contaminants above background and/or regulatory standards. Upon evaluation of each medium, Parsons recommended additional field sampling and investigations for three of the four AOCs to further characterize the groundwater, surface water, and soil pathways.

In 2003, Parsons conducted a Final ESI, as a follow-up to the FSI. Based on exceedances found in the FSI samples, Parsons recommended that three sites (Stockpile Area No. 1, Stockpile Area No. 2, and the Medical Supplies Burial Area) be investigated further to determine the nature and extent of the contamination. Additional environmental sampling was performed in surface and subsurface soil, surface water, and groundwater. Samples were analyzed and screened against applicable standards.

Based on the sampling, sediment, surface water, surface soil, and subsurface soil samples had results for some metals that were greater than either the background values or 2008 Maryland Department of the Environment (MDE) non-residential soil cleanup standard (Parsons, 2003). Based on these results, Parsons recommended further environmental sampling of the groundwater, surface water, and soil pathways to determine the nature and extent of the reported contamination.

1.4.2 Final Revised DSNC Focused RI (FRI), Parsons

In 2005, Parsons conducted an FRI to delineate the nature and extent of contaminations within specific AOCs identified during their previous FSI and ESI activities, and within areas of known DoD activity not previously investigated. AOCs associated with known DLA/DNSC activities were designated, including four ore stockpile areas, a medical supplies burial area, and areas identified by MDE as requiring further investigation. Ore stockpiles included (but are not limited to) ferromanganese and manganese ores. A Human Health Risk Assessment (HHRA) and an Ecological Screening Level Risk Assessment were conducted to evaluate the human health and environmental risks associated with Depot activities. Parsons collected more than 200 surface/subsurface soil (using discrete sampling methodology), sediment, surface water, and groundwater samples from AOCs designated within the property. The HHRA and the Ecological Screening Level Risk Assessment did not identify any contaminants of concern for any receptors, determined there was no risk to human health or the environment, and concluded that no further evaluation was warranted for the Depot associated with the AOCs that were investigated (Parsons, 2006).

1.4.3 Environmental Survey and Analysis Report (ESAR), EA

In 2011, EA Engineering, Science, and Technology, Inc. developed a Final Environmental Survey and Analysis Report (ESAR) for the Depot. The ESAR documented areas of potential environmental concern (ECs) and whether potential ECs may have impacted the soil or groundwater as a result of past or current uses of the Depot. Past uses may have involved hazardous materials, hazardous substances, hazardous wastes, or petroleum products. To prepare the ESAR, EA reviewed previously developed documentation, and performed on-site reconnaissance and interviews. The ESAR summarizes the environmental suitability of the Depot by identifying and characterizing potential ECs.

The ESAR classified each of the 63 identified ECs into one of seven categories; each category provides the environmental condition of the EC and whether additional investigations were required. The categories were based on the current or former presence of operations that involved hazardous materials, hazardous substances, hazardous wastes, or petroleum products. The report presents detailed information on the Depot's utilities and infrastructure, hazardous substances and petroleum products, stockpiled materials, medical and biohazardous waste, suspected asbestos-containing material, lead-based paint, radioactive materials/wastes, military munitions/ordnance, and polychlorinated biphenyl. The report concluded that 22 ECs (seven MMRP and 15 IRP ECs) required additional investigations, in the form of an RI.

1.4.4 Remedial Investigation/Feasibility Study for MMRP and IRP ECs, ERT

In 2016, ERT conducted an RI of the ECs that included surface soil, subsurface soil, sediment, surface water, and groundwater sampling to investigate potential human health and environmental risks. ERT collected a total of 826 discrete samples, including 583 primary surface and subsurface samples, 26 groundwater samples, four sediment samples, six surface water samples, and 183 quality control (QC) samples. Based on the results of this sampling and the HHRA and Screening Level Ecological Risk Assessment (SLERA) results, all but two ECs, EC-21 and EC-32, were recommended for no further action, while additional human health and ecological risk assessments are being conducted for EC-21 and EC-32.

As part of the RI data evaluation, it was determined that further evaluation, including a reassessment of the CSM and data gap analysis was needed for arsenic and manganese.

1.5 Areas of Investigation for the RI

ERT investigated arsenic and manganese impacts within the boundaries of the Former Curtis Bay Ordnance Depot that are currently owned by the GSA and managed by the DLA, except for the area that is undergoing a Non-Time Critical Removal Action (NTCRA), as shown in Appendix A, Figure 2. The investigation area for this RI is approximately 425 acres and does not include the Anne Arundel County Facility or U.S. Army Reserve Dock, which are not owned by GSA.

The 2016 RI sampling results for arsenic in the IRP Shop Area and manganese in the EC-57D area were not consistent with the EC RI CSM for those areas. Boundaries for the IRP Shop Area and

EC-57D are shown in Appendix A, Figure 2 and previous sampling results are shown in Appendix A, Figure 4. The EC RI CSM identified point sources of arsenic contamination, primarily treated wood storage and use. As the results are wide-spread and are not consistent in magnitude, these results do not appear to be related to the EC-specific activities. Historical Depot activities that may have contributed to the widespread, non-point source arsenic contamination potentially include herbicide/pesticide usage and/or material stockpiling. Therefore, further evaluation including a reassessment of the CSM and data gap analysis was recommended to determine the source of the elevated arsenic concentrations in the IRP Shop Area.

Because manganese concentrations in soil were higher north of the EC-57D boundary (Appendix A, Figure 2), ERT reviewed the historical documentation for the Depot to determine if there were sources of manganese other than the storage of munitions in this EC. During this review, it was determined that a historical manganese ore stockpile existed just north of EC-57D (Parsons, 2006). Locations in the northern portion of the EC and north of the EC boundary correlate with the higher analytical concentrations around the historical stockpile area. Manganese concentrations generally decrease outside of the original 2005 RI stockpile boundary; therefore, it appears that the 2016 RI manganese concentrations are not related to historical munitions-related activities associated specifically with EC-57D. Consequently, further evaluation including a reassessment of the CSM and data gap analysis was recommended to determine the source of the elevated manganese concentrations in the EC-57D Area.

Arsenic and manganese results that were greater than PSLs were found primarily in the surface soil samples. Surface soil was defined as 0 – 0.5 ft bgs during the EC RI. Therefore, a surface soils sampling interval of 0 – 1 ft bgs and subsurface soil sampling interval of 1 – 2 ft bgs were used to sufficiently delineate arsenic and/or manganese impacted soil within the Depot during this RI.

1.6 Report Organization

This report is organized in general accordance with the suggested RI report table of contents presented in the U.S. Environmental Protection Agency (USEPA) Guidance for Conducting RI/FS (USEPA, 1988) and the U.S. Army (Army) MMRP RI/FS Guidance (USACE, 2009).

Sections 1.0 and 2.0 present the introduction, history, and site description. Section 3.0 presents the investigation approach and Section 4.0 presents the assessment of analytical data quality. Section 5.0 presents the RI results. Section 6.0 describes the contaminant fate and transport. Section 7.0 presents a summary of the HHRA and SLERA. Section 8 presents the revised CSM. Section 9.0 presents the conclusions and recommendations for the Former Curtis Bay Ordnance Depot. Section 10 presents the references. All figures are presented in Appendix A. Other appendices present meeting minutes, Analytical Data, the complete HHRA and SLERA, a Photographic Log, and Field Documentation.

2.0 SITE DESCRIPTION AND ENVIRONMENTAL SETTING

2.1 Surface Features

Elevations at the Depot range from approximately 10 ft above mean sea level in the south to approximately 50 ft above mean sea level to the north (U.S. Geological Survey [USGS], 2011). The land surface generally slopes south-southeast (EA, 2011).

Surface features of the Depot have been significantly impacted by anthropogenic activities throughout the years. The U.S. Army Ordnance Depot was originally built in 1918 on 789 acres of farmland and surface features changed drastically up until the early 1990's. As a Depot, the properties main purpose was the receipt, storage, and maintenance of supplies both foreign and domestic.

To accommodate the storage and stockpiling of large quantities of materials, many miles of railroad tracks were built, interconnecting nearly all areas of the Depot-wide property. Large warehouses were located throughout the property, many of which are collapsed or have been demolished. Many revetments and berms were created to facilitate the demilitarization of ammunition and prevent train cars from over-running tracks. In 1952, GSA's new strategic and critical materials stockpile program started and much of the Depot was used for stockpiling large quantities of materials – such as various internationally sourced mineral and metal ores. Most of these stockpile areas were paved, graveled, and/or concrete pads were poured. Like the miles of intertwined railroad connecting nearly every acre of the property, an intricate network of roads exists to expedite the efficient transfer of materials and personnel throughout the Depot.

2.2 Hydrogeology

The Depot groundwater is part of the Patuxent reservoir, which is confined by the Arundel clay formation. The Patuxent formation, near Baltimore, is known to yield high supplies of groundwater ranging from 400 to 600 gallons per minute. As part of prior investigations, driller's logs have demonstrated varying degrees of thickness within the sand and gravel units, suggesting that the hydrologic properties of the Patuxent formation may not be uniform (USACE St. Louis, 1993). The Depot is supplied with drinking water by the Glen Burnie public water supply system. Baltimore City supplies the drinking water for the properties surrounding the Depot.

Approximately one half of the Depot's perimeter is bounded by creeks. An unnamed tributary, located in the center of the Depot, drains approximately one half of the Depot's surface water to Back Creek. From Back Creek, the water flows east to Furnace Creek then to Curtis Creek, eventually flowing into Curtis Bay and the Patapsco River, within the Chesapeake Bay. It is possible that the Depot may experience flooding from the unnamed tributary, or in the case of storm surges, from the Chesapeake Bay backwater (USACE St. Louis, 1993).

2.3 Climate

Curtis Bay is located within the Mid-Atlantic States with weather consisting of four distinct seasons. The average temperatures in the summer and winter are in the mid-80s [Fahrenheit (°F)]

and mid-30s (°F), respectively. July is the warmest month of the year with an average high temperature of 90°F; January is the coldest with an average low temperature of 29°F. Daily temperature variations between night and day in the summer may reach up to 18°F in difference, while daily temperature variations in the winter average approximately 15°F in difference (U.S. Army Engineering and Support Center Huntsville [CEHNC], 2011).

The annual average precipitation is 43.59 inches. Rainfall is evenly distributed throughout the year. The wettest month of the year is May with an average rainfall of 4.18 inches (EA, 2011).

2.4 Geology

The Depot lies within the Atlantic Coastal Plain physiographic province, which is characterized by soft, unconsolidated sediment dating from the lower Cretaceous to the Pleistocene age. This soft, unconsolidated sediment generally overlies crystalline bedrock, which is predominately composed of gneiss, schist, and gabbroic rocks from the Pre-Cambrian and Paleozoic eras.

The Pre-Cambrian-Paleozoic age crystalline bedrock has been affected greatly by intrusions, pressure from folding, and periods of erosion. Characteristic of the Coastal Plain depositional environment during the Cretaceous age, the younger, overlying, unconsolidated sediments comprise non-marine, irregularly bedded, and lenticular sediments due to their down gradient location from the Piedmont Plateau. The three formations deposited during the Cretaceous age are the Patuxent, the Arundel clay, and the Patapsco. The oldest Cretaceous age formation, the Patuxent, is defined by a series of lenticular beds of sands, gravels, and clays. The Patuxent is further defined as being unfossilerous, lacking in a characteristic color, and ranging in thickness from 200 to 300 ft. The depositional environment of the Arundel Clay is swamp-like, as evidenced by lignitic material and organic matter such as tree trunks and roots. The Arundel clay, ranging in thickness from 25 to 200 ft in the Baltimore area, is characterized by gray and red clay containing geodes and nodules of limonitic material. The Arundel clay formation is considered to be a confining layer (USACE St. Louis, 1993). The Patapsco Formation is at the surface, and it consists of "gray, brown, and red variegated silts and clays; lenticular, cross-bedded, argillaceous, subrounded sands; and minor gravels" (Cleaves, et al., 1968).

2.5 Demography and Land Use

There are currently no active uses of the Depot. The property is zoned for "W2 - Industrial Light" (Anne Arundel County, 2019) use and the future land use is expected to remain industrial. Ownership of the property is expected to be transferred once all environmental investigations are complete. Once transferred, the property will likely be developed for industrial uses.

2.6 Ecology

Since the Depot was declared as excess property in 2005, surface features of the Depot have been influenced by ecological succession. The invasive Bradford Pear (Pyrus calleryanan) is widespread throughout the property. The Depot has been filled, drained, graded and otherwise altered to the point that there are no natural areas remaining, although there are areas of the Depot now covered by successional fields and successional hardwood forests. Currently, the site features

consist of warehouses in various stages of disrepair, concrete pads where warehouses once stood, a network of paved and gravel roads, numerous revetments and large piles of spoil, and abandoned railroad tracks and railroad beds.

A large central drainage ditch and numerous shallow ditches convey surface water to discharge into adjacent open water bodies, with very little surface water retained on site. The majority of the ditches draining the site are small, intermittent, and support wetland species like cattail and giant reed. Most of the area outside the project boundary and within a half-mile radius is urban land or open water.

Additional information on the Depot ecology is provided in the SLERA (Section 7.2).

2.6.1 Sensitive Habitats

Based on a review of the National Wetlands Inventory (2019), approximately 10 acres of wetlands were identified within the Depot boundary, primarily along the edges of the Depot where they meet Back Creek and Furnace Creek, as well as along the unnamed tributary. These areas are part of the investigation area for this project

The nearby Curtis Bay Channel, Patapsco River, and Stoney Creek have been identified as Historic Waterfowl Staging and Concentration Areas. Portions of the Depot are within the Critical Buffer Area (Anne Arundel County, Maryland, 2007).

2.6.2 Endangered, Threatened, or Special Concern Species

No rare, threatened, or endangered species or rare habitats have been documented at the Depot (EA, 2011; Parsons, 2006; CEHNC ,2011). Sensitive bird species, such as the formerly federally-endangered peregrine falcon (Falco peregrinus), with the formerly state-threatened and formerly federally-threatened bald eagle (Haliaeetus leucocephalus), and the osprey (Pandion haliaetus) have been recorded breeding in the vicinity (two to four miles) of the Depot (Parsons, 2006; CEHNC, 2011). Many pairs of P. haliaetus were observed on site during this RI, exhibiting nesting and breeding behaviors.

The Depot is not within the recorded range of most rare, threatened, or endangered fish, reptile, or amphibian species in Maryland (Maryland Department of Natural Resources [MDNR] 2007; MDNR, 2010). Additionally, the Depot does not contain suitable habitat for species of interest that do occur within Anne Arundel County, such as the state-endangered eastern tiger [redacted] (Ambystoma tigrinum) and the state-rare northern scarletsnake (Cemophora coccinea copei).

Additional information on the species found within the Depot is provided in the SLERA (Section 7.2.1.2).

This Page Intentionally Left Blank

3.0 INVESTIGATION APPROACH

The goals of the investigation activities were to determine the nature and extent of arsenic and/or manganese impacts in surface and subsurface soil at the Depot, potentially caused by prior DoD use, determine potential risks to human health and/or the environment, and to recommend whether further environmental management decisions are warranted. This section discusses the investigation that was conducted to make these determinations for arsenic and manganese. RI field investigations were conducted in accordance with the technical project planning (TPP) meeting (Appendix C) and the Final UFP-QAPP (ERT, 2019), except as detailed in Section 3.3.

3.1 Data Needs

Data were needed to assess the nature and extent of potential arsenic and manganese contamination resulting from past practices at the Depot. Environmental sampling and analysis were conducted to determine the distribution and concentrations of arsenic and manganese in surface and subsurface soil. All sample data were screened against the relevant comparison criteria (Section 3.2.2) to evaluate potential risks due to human health and/or the environment to achieve the RI objectives.

3.1.1 Preliminary Conceptual Site Model

A CSM was developed in accordance with EM-200-1-12 (USACE, 2012), to illustrate the mechanisms by which arsenic and manganese from past DoD activities at the Depot could potentially migrate from affected source media to the point of exposure where contact with receptors may occur.

3.1.1.1 Human and Ecological Receptors

Due to the limited use of the Depot property, potential human receptors at the Depot are likely limited to authorized site workers, which could include outdoor workers (mowing and maintenance activities) and construction workers (potential intrusive activities). While the site is mostly fenced and there are gates along the Depot entrance areas, the fence is not maintained and has areas where trespassers can get onto the property. Evidence of trespassers has been seen during site visits to include: the potential use of the buildings for shelter by homeless people, and lawn chairs and beer kegs along the creeks edge and within the Depot boundaries. Additional anecdotal information on the trespassers has been provided by the U.S. Army Reserve staff who have "chased people off of the Depot property" when they see them. Ecological receptors include terrestrial plants, soil invertebrates, reptiles, amphibians, birds, and mammals.

The preliminary CSMs indicate the potential for site workers, trespassers, and biota to be exposed to arsenic and/or manganese in surface soil at the Depot. The preliminary CSMs indicate the potential for construction workers to be exposed to arsenic and/or manganese in surface and/or subsurface soil at the Depot. This is based on the historical data collected at the Depot detailed in Section 1.4.

3.1.1.2 Contamination Sources

Section 1.4 presents the results of the previous investigations of arsenic and manganese at the Depot. A complete list of historical Depot activities within the investigation area that may have contributed to arsenic and manganese is not known. Pesticide/herbicides were reportedly used at the Depot around the railroad tracks, buildings, and ore stockpiles (Parsons, 1999). However, the Depot was built on farmland (Parsons, 1999) and pesticides/herbicides were likely used. Stockpiles of raw ores, some of which contained arsenic and/or manganese were stored throughout the Depot (Parsons, 1999). Arsenic and manganese also occur under natural conditions as a result of both chemical and physical weathering process on parent rock. Therefore, the known potential contributors to arsenic and manganese in soil include:

- Ore stockpiles (arsenic and manganese);
- Anthropogenic sources (pesticide/herbicide use [arsenic], atmospheric deposition [arsenic and manganese]); and
- Natural sources.

3.1.1.3 Transport Process

Metals may dissolve in surface water or become sorbed to the soil. Contaminants may move between dissolved and sorbed states depending on a variety of physical and chemical factors.

The fate and transport of the arsenic are dependent on a wide variety of factors. Contaminant fate refers to the expected final state that an element, compound, or group of compounds will achieve following release to the environment. Contaminant transport refers to the mechanisms and rates of migration of contaminants away from the source area. Migration pathways often include air, water, soil, sediment, and the interfaces between the phases of the contaminant (i.e., solid, liquid, or gas). The fate and transport of contaminants occur in all environmental media: terrestrial, aquatic, and atmospheric. Terrestrial environments comprise soil and groundwater; aquatic environments include surface water, marsh, and, sediment; and air is the only component of the atmospheric environment.

Most metals are indigenous to the earth and are found in varying concentrations in most environmental media. Some metals accumulate in animal tissues and others accumulate in plant tissues. Metals do not degrade. However, the mobility and toxicity of some metals are affected by changes in the oxidation state (e.g., chromium).

3.1.1.4 Exposure Pathways

A complete exposure pathway contains a contaminant source, a mechanism for transport, receptor access to the contaminant, and an exposure route. Exposure could potentially occur via dermal contact, inhalation of dust, and/or incidental ingestion during routine caretaker activities, a future construction project, or trespassing. Plants may uptake contaminants from the soil and contribute contaminants to the food chain, creating an additional exposure pathway for humans and animals.

Current and future site workers may be exposed to arsenic/manganese impacted surface soil by wind-blown dust or incidental (e.g., during mowing or other maintenance activities) or intentional

(e.g., during landscaping and landscape maintenance) contact with soil. Future construction workers may be exposed to arsenic/manganese impacted surface and/or subsurface soil during construction activities. Current and future trespassers may be exposed to arsenic/manganese impacted surface soil by wind-blown dust or contact with soil while sitting along the creek edge or within the Depot, or when trying to enter the property through fence opening. It is not likely that current and future trespassers will engage in activities that expose them to the arsenic/manganese impacted subsurface soil; therefore, this is not considered a complete pathway.

Previous investigation sampling and analysis included groundwater, sediment, and surface water. Groundwater samples were collected at 34 locations throughout the Depot. Four co-located sediment and surface water samples were collected within the unnamed tributary. All groundwater, sediment, and surface water samples were analyzed for arsenic and manganese (ERT, 2016). Arsenic and manganese were not identified as chemicals of potential concern (COPCs) in groundwater during the human HHRA of the previous investigation. Therefore, groundwater is considered an incomplete exposure pathway. Similarly, arsenic and manganese were not identified as COPCs in the HHRA for surface water or sediment during the previous investigation (ERT, 2016). Arsenic was identified as a chemical of potential ecological concern (COPEC) in sediment, however, the SLERA determined there was no unacceptable risks to the environment from arsenic in the sediment (ERT, 2016). Manganese was not identified as a COPEC in sediment in the SLERA. Arsenic and manganese were not identified as COPECs in surface water. Therefore, surface water and sediment are also considered incomplete exposure pathways.

The IRP Shop Area has been designated as Decision Unit (DU) 2. The EC-57D area has been designated as DU 3. DU 1 is the remainder of the Depot that is not in the NTCRA, DU 2, or DU 3 areas. Within DU 2 and DU 3, the pathways for surface soil were considered complete as previous investigations in these areas indicate a release of arsenic (DU 2) or manganese (DU 3) in surface soil. Within DU 2 and DU 3 the pathways for subsurface soil were considered potentially complete until subsurface soil contaminant source areas were identified. A graphical representation of the preliminary exposure pathways for the DU 2 and DU 3 areas are shown in Appendix A, Figure 3a.

Within the remaining area of investigation, previous sampling results for arsenic and manganese that were greater than the PSLs were scattered throughout the investigation area with no clear indication that results may represent an unacceptable risk to human health and/or the environment (see Appendix A, Figure 4). In addition, the distances between previous sampling locations are, in many cases greater than 200 feet and there are large areas where no soil sampling was conducted. As a result, it was unknown if source areas for arsenic or manganese existed within the remaining investigation area, DU 1. Therefore, the surface soil pathways were considered potentially complete in the remaining area of investigation until surface soil sampling was completed during this RI.

Based on previous sampling results, it was not considered likely that arsenic and/or manganese concentrations in subsurface soil would pose an unacceptable risk to human health and/or the environment unless arsenic and/or manganese were found in the surface soil at concentrations that would pose an unacceptable risk to human health and/or the environment. However, the pathway for subsurface soil was considered potentially complete until sampling results demonstrated otherwise within the remaining area of investigation. A graphical representation of the preliminary exposure pathways for the remaining investigation area, DU 1, is shown in Appendix A, Figure 3b.

Updated CSMs based on the current RI sampling results and/or the HHRA/SLERA conclusions are presented in Section 7.

3.1.2 Data Quality Objectives

Data quality objectives (DQOs), including laboratory analytical DQOs for environmental sampling, were developed and presented in the approved UFP-QAPP (ERT, 2019) to support the determination of the nature and extent of arsenic and/or manganese contamination at the Depot and to recommend whether further actions are warranted. All DQOs were reviewed and accepted by the Project Delivery Team prior to beginning field activities. The DQOs are presented in Table 3-1.

Table 3-1. Soil Investigation DQOs – Former Curtis Bay Depot

DQO Element	Specific DQO Statement
Project Objective(s) Satisfied	To determine the nature and extent of arsenic and/or manganese contamination.
Data User Perspective(s)	To obtain representative soil data to determine if an arsenic (As) and/or manganese (Mn) release has occurred, and if a release is identified, define nature and extent of As/Mn, and compare results against defined screening levels and background sampling results. Conduct an HHRA and SLERA to determine if there are human health and/or ecological risks associated with contamination present in soils due to past DoD activities.
Contaminant or Characteristic of Interest	Based on historical use of the Former Curtis Bay Depot and historical data, analyze the media of interest for the following metals (As and Mn)
Media of Interest	Surface (0-1 ft bgs) and subsurface (1-2 ft bgs) soil
Required Sampling Locations or Areas	Three decision units (DUs) defined based on previous soil sampling results for As/Mn.
Number of Samples Required	A. 87 incremental sampling (IS) surface soil samples (exclusive of background and QC replicates) B. 87 IS subsurface soil samples (exclusive of background and QC replicates) C. 7 IS surface and 7 IS subsurface background soil samples (exclusive of QC replicates)
Reference Concentration of Interest or Other	PSLs included U.S. Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) for residential and industrial soil,

Table 3-1. Soil Investigation DQOs – Former Curtis Bay Depot	
DQO Element	**Specific DQO Statement**
Performance Criteria	USEPA Region III Biological Technical Assistance Group (BTAG) Screening Benchmarks, and background As and Mn concentrations. Comparisons to these criteria to be utilized along with comparisons to background results, to determine contaminant extent, and, subsequently as warranted, to select COPCs and COPECs for an HHRA and SLERA. Exceedances of background As and Mn concentrations will determine the need for remedial action(s).
Sampling Methods and Depths	A. IS method for surface soil in the 0-1 ft bgs interval using a step probe. B. IS subsurface soil samples will be at 1 ft to 2 ft bgs. IS subsurface soil samples will be collected using a step probe. C. A Geoprobe will be used in areas where soil/substrate conditions prevent the use of a step probe.
Analytical Methods	Metals analysis by CT Laboratories, LLC via analytical method SW-846 Method 6010C[1].

1. The UFP-QAPP incorrectly identified analytical method SW-6020A. However, CT Laboratories, LLC does not perform this method. See Section 3.3.4 for more details.

3.2 Characterization of Arsenic and Manganese in Soil

The DUs for arsenic and manganese soil sampling were based on previous soil sampling data for arsenic and/or manganese, primarily in surface soil, where concentrations were greater than the previous investigation PSLs. Previous sampling results indicate that:

- arsenic is present in the DU 2 at concentrations greater than the PSL that was used at the time;
- manganese is present in the DU 3 at concentrations greater than the PSL that was used at the time; and
- arsenic and manganese are present at various locations in the remaining area of the Depot (DU 1) at concentrations greater than the PSLs that were used at the time.

3.2.1 General Approach

ERT's sampling approach reflected the approved UFP-QAPP procedures intended to allow for identifying arsenic and manganese concentrations in the soils at the Depot and provide sufficient data of sufficient quality for the risk assessments. The target populations (surface [0-1 ft bgs] and subsurface soil [1-2 ft bgs]) were the set of all possible sampling units within each surface and subsurface DU. Thus, there are six DUs defined for this investigation (the horizontal extents of each DU are shown in Appendix A, Figure 4). DU 1A is the surface soil DU and DU 1B is the subsurface soil DU for the remaining area (not including the IRP Shop Area and EC-57D), where there is no defined release of arsenic and/or manganese, based on previous investigations. DU 2A is the surface soil DU and DU 2B is the subsurface soil DU in the IRP Shop Area where an arsenic release was identified during previous investigations. DU 3A is the surface soil DU and DU 3B

is the subsurface soil DU in the EC-57D Area where a manganese release was identified during previous investigations.

The sampling unit (SU) size was based on the current and (assumed) future industrial land use of the Depot. Therefore, all sampling units (SUs) for this investigation were approximately 150 ft x 150 ft (approximately 0.52 acres). An SU is the area over which each incremental soil sample was collected during the RI. Note that, due to property access restrictions, no sampling occurred outside of the DU boundaries. Grids (150 ft x 150 ft) that overlapped the Depot boundaries were truncated at the property boundary, adjacent truncated areas were combined to form SUs so that the maximum SU area was approximately 0.52 acres (150 ft x 150 ft) and the minimum SU area was 0.32 acres. Thirty increments were collected from each SU, irrespective of the size of the SU. Appendix A, Figures 5 through 7 show the SUs for each site DU.

ERT conducted background surface and subsurface soil sampling in the U. S. Army Reserve Property. Background sampling consisted of seven surface soil SUs (DU 4A) and seven subsurface soil SUs (DU 4B). Locations were selected so that they were not in paved areas or wetlands. Background SUs are shown in Appendix A, Figure 8.

All Incremental Sampling Methodology (ISM soil) samples were submitted to CT Laboratories, LLC. (CT) for analysis of arsenic and manganese via USEPA method SW-846 6010C[1].

3.2.2 Comparison Criteria

To support the HHRA and SLERA, the soil sampling results were compared to the USEPA RSLs for residential soil (USEPA, 22020b), the USEPA RSLs for industrial soil (USEPA, 2020b), and the USEPA Region III BTAG Screening Benchmarks (USEPA, 1995a). Although the Depot is zoned for industrial use, the USEPA RSL for residential soil were used in the RI to evaluate the risks to future hypothetical resident receptors (child and adult) to support the development of a cleanup alternative in the FS, if necessary, that allows for residential land use. A residential cleanup alternative is typically developed so that DoD can consider the measures necessary to allow "unrestricted use/unrestricted exposure" (UU/UE) of the land. Because UU/UE is interpreted to mean residential land use, it is necessary to determine if unacceptable risk is posed by arsenic or manganese to hypothetical residential receptors.

In addition, site sampling results were compared to background threshold values (BTVs). The BTVs are a measure of the concentrations of naturally occurring and anthropogenic sources of chemicals at locations with similar soil properties, but which are not influenced by releases from the site. BTVs are used for comparing individual site sampling results. BTVs are estimated by statistics representing the upper tail of the background data distribution and are intended to cover the range of background data at some confidence level (e.g., 95%). BTVs were calculated using

[1] The UFP-QAPP incorrectly identified analytical method SW-6020A. However, CT Laboratories, LLC does not perform this method. See Section 3.3.4 for more details.

the surface and subsurface soil sampling results from seven background SUs and ProUCL version 5.1 software and technical guidance (USEPA, 2015). Statistical analysis of the background sampling results indicated that the surface soil data were not significantly different than the subsurface soil data for arsenic or manganese. Therefore, the surface soil and subsurface soil data were combined into a single data set to develop the BTVs. A complete discussion of the development of the BTVs and the BTV statistics used is provided in Appendix D.1.

Project screening values are provided in Table 3-2.

Table 3-2. Project Screening Levels

Parameter	Chemical Abstract Service Number	BTV (mg/kg)	USEPA Residential (mg/kg)	USEPA Industrial (mg/kg)	USEPA BTAG (mg/kg)
Arsenic	7440-38-2	7.8	0.68	3	328
Manganese	7439-96-5	460.5	900	13,000	330

Legend:

BTV	*Background Threshold Value*
USEPA Residential	*May 2020 USEPA RSL for residential soil, with a target cancer risk level of 1 x 10^{-6} and hazard quotient = 0.5 (USEPA, 2020b, 2020c)*
USEPA Industrial	*May 2020 USEPA RSL for industrial soil, with a target cancer risk level of 1 x 10^{-6} and hazard quotient = 0.5 (USEPA, 2020b, 2020c)*
USEPA BTAG	*USEPA Region III Biological Technical Assistance Group Screening Benchmarks (USEPA, 1995a)*
mg/kg	*milligrams per kilogram*

3.2.3 Soil Sampling

Soil samples were collected in March and April 2019. A photographic log of the field sampling efforts is included in Appendix E and the field documentation is provided in Appendix F.

3.2.3.1 DU 1

DU 1 constitutes the remaining area of the Depot that is controlled by GSA, excluding DU 2, DU 3, and the NTCRA area (Appendix A, Figure 5). DU 1 is the portion of the site-wide investigation area that shows diffuse potential arsenic and manganese contamination, based on previously collected discrete surface soil samples. As part of the selection of DUs, it was determined that site workers and trespassers would be traveling over the whole area, and there is no clear pattern to suggest special areas of concern within DU 1. Based on the historical data, the majority of potential contamination is in the surface soil. However, subsurface soil was sampled during this investigation to determine the vertical extent of potential arsenic and manganese contamination across DU 1. DU1A consisted of 59 surface soil SUs and DU 1B consisted of 59 subsurface soil SUs. The determination of the number and location of the SUs was determined using Visual Sampling Plan (VSP) and is discussed in detail in the approved Final UFP-QAPP (ERT, 2019). A total of 118 soil samples (plus QC replicates), each consisting of 30 increments, were collected from the 118 SUs in DU 1.

3.2.3.2 DU 2

DU 2A and DU 2B are located in the IRP Shop Area (Appendix A, Figure 6). As shown on Appendix A, Figure 6, the DUs are covered by 18 SUs. DU 2A consisted of 18 surface soil SUs and DU 2B consisted of 18 subsurface soil SUs. A total of 36 soil samples (plus QC replicates), each consisting of 30 increments, were collected from the 36 SUs in DU2.

3.2.3.3 DU 3

DU 3A and DU 3B (Appendix A, Figure 7) are based around the EC-57D area as it was defined in the prior RI. During the previous investigations, manganese concentrations that were greater than background concentrations were seen primarily in surface soil. As shown on Appendix A, Figure 7, the DU 3 DUs are covered by 10 SUs. DU 3A consisted of 10 surface soil SUs and DU 3B consisted of 10 subsurface soil SUs. A total of 20 soil samples (plus QC replicates), each consisting of 30 increments, were collected from the 20 SUs in DU 3.

3.2.3.4 Background (DU 4)

ERT conducted background surface and subsurface soil sampling in the U. S. Army Reserve Property. The background area was selected based on a review of historical records for the Former Curtis Bay Depot. During the use of the background area for the Depot, the area selected for the background sampling contained administrative and housing for base personnel and was not used for other mission support activities. Therefore, this area is not likely to be impacted by the ore pile storage and related activities associated with the potential arsenic and manganese impacts to site soil. Background sampling consisted of seven surface soil SUs (DU 4A) and seven subsurface soil SUs (DU 4B). Locations were selected so that they were not in paved areas or wetlands. DU 4A consisted of seven surface soil SUs and DU 4B consisted of seven subsurface soil SUs (Appendix A, Figure 8). A total of 14 soil samples (plus QC replicates), each consisting of 30 increments, were collected from the 14 SUs in DU 4.

3.3 UFP-QAPP Variances

Although every effort was made to adhere to the UFP-QAPP, variances from the UFP-QAPP are noted below.

3.3.1 **Puck mill vs Ball Mill**

The UFP-QAPP specified the use of a Teflon-coated ball mill for the processing of ISM soil samples, however a puck mill was used for ISM soil sample processing. CT Laboratories expressed concern that although they do possess Teflon-coated ball mills for sample preparation, this equipment has limited capacity with regard to the ISM soil sample mass (5-15 kilogram [kg]) for samples collected at the Depot. ERT and CT provided information to the PDT on using the puck mill for sample preparation that included analysis of arsenic and manganese in method blank and spiked laboratory control samples to determine the effects of puck mill grinding on soil sample analysis. Use of the puck mill was approved by the PDT (see Appendix C) on 12 March 2019.

3.3.2 Background Area Sample Naming

The field team inadvertently changed the designation of the background sampling area to DU4 instead of BKG, as specified in the UFP-QAPP. Although the field team recognized this error, all background samples were named as using the DU4 designation to maintain consistency with the initial background samples.

Example:
The subsurface sample collected from SU 2 in the background area was labelled as *DU4B-SU02*.

3.3.3 SU Increment or Location Offsets

During field sampling, the field team determined that either the increments within an SU or an entire SU needed to be moved in 23 SUs within DU 1 in order to collect the required samples. Table 3-1 presents the SUs in DU 1 that were moved or where increments were offset, and the reason for the offset. Increments were also offset as necessary in DU 2 to accommodate remaining site structures (buildings and/or foundations), but no SUs were moved. Increments were offset to an accessible location as close to the original increment location as possible (i.e., at boundary of obstruction or adjacent to fence). The planned number of increments (30) were collected for all SUs.

Table 3-3. Offset Sampling Units		
Decision Unit	**Sampling Unit**	**Reason for Offset**
DU 1	SU01	SU inaccessible due to property fence and main site entry road.
	SU03	SU outside property fence.
	SU04	SU on heavily graveled railroad bed.
	SU05	SU on heavily graveled railroad bed.
	SU06	Original location of SU consisted of roadway and concrete pad.
	SU10	Original location of SU was in the road
	SU11	SU on heavily graveled railroad bed.
	SU12	SU on heavily graveled railroad bed and main road.
	SU13	SU moved off of fence line due to roadway (East Ave.).
	SU14	SU offset due to heavily graveled area
	SU17	SU moved off of apparent former gravel parking area
	SU19	Increments offset due to former building foundation.
	SU28	SU moved due to fence and due to being partially located on the U.S. Army Reserve dock property.
	SU31	SU moved to avoid former gravel parking area
	SU35	Increments offset to avoid boundary fence.
	SU40	SU offset to avoid barricade.
	SU42	Increments were offset to avoid obstructions (road, concrete pad, and gravel).
	SU46	Increments located within the sidewalk were offset.
	SU51	Several increment locations were offset due to fence.
	SU53	Several increment locations were offset due to former railroad tracks.
	SU54	SU was within the NTCRA support area.
	SU55	Original location on top of former building foundation
	SU56	Five increment locations were offset due to former building foundation.

3.3.4 Analytical Method

The UFP-QAPP incorrectly specified analysis of arsenic and manganese via analytical method SW846 6020A. However, CT is not certified to perform this method. Therefore, CT used analytical method SW846 6010C for all samples collected. The limit of quantitation (LOQ) for arsenic analyzed via method SW846 6010C does not achieve the necessary sensitivity for the USEPA RSL for residential soil screening level for arsenic (0.68 mg/kg).

The LOQs, limits of detection (LODs), and detection limits (DLs) for method SW846 6010C are:

- Arsenic - LOQ = 0.80 mg/kg, LOD = 0.40, DL = 0.13, and
- Manganese - LOQ = 0.15, LOD = 0.075, DL = 0.025.

Therefore, all samples for which the analytical results for arsenic that were less than the LOQ using analytical method SW846 6010C (i.e., analytical results were non-detect [U qualified] or detected at concentrations less than the LOQ [J qualified]) were also analyzed via analytical

method Graphite Furnace Atomic Absorption (GFAA) 7010. The LOQ (0.16 mg/kg), LOD (0.08 mg/kg), and DL (0.04 mg/kg) are less than the USEPA RSL for residential soil screening level for arsenic (0.68 mg/kg).

3.3.5 Subsampling of Large Mass Samples

Collecting 30 increments over 1-ft intervals generated samples in excess of the required 2 kg mass. Field methods were used to reduce the sample mass and laboratory sample processing. In accordance with the Interstate Technology Regulatory Council (ITRC) Incremental Sampling Guidance (ITRC, 2012), the field team used core wedging to reduce the amount of sample mass obtained when using the DPT method (masses were greater than 10 kg). Field split samples were collected at 10% of the SUs where field splitting was used (split sample collected at DU1A-SU30 and DU1B-SU30) to quantify errors that may have been associated with the core wedging. All relative standard deviations (RSDs) for the field split samples were less than 30 percent indicating that the field splitting did not result in increased sample result uncertainties.

4.0 DATA QUALITY ASSESSMENT

The data quality assessment (DQA) describes the evaluation of the data quality indicators (DQIs) that were used to assess the overall quality of the soil analytical data collected during the RI field activities. The DQIs are assessed with respect to the DQOs. Project DQOs presented in Worksheet #11 of the UFP-QAPP establish the data uses, users, and provides objective criteria by which the data quality can be measured. Moreover, the DQO process identifies the protocols, processes, procedures, and methods by which the DQOs can be met. Achievement of DQOs provides the basis for concluding that the acquired investigation data are scientifically sound, legally defensible, and adequate for their intended use. The DQI's – precision, accuracy/bias, representativeness, comparability, completeness, and sensitivity (PARCSS) – were defined in Worksheet #37 of the UFP-QAPP (ERT, 2019) and were evaluated and incorporated into this data usability assessment.

The analytical data were validated in accordance with specifications given in the UFP-QAPP (ERT, 2019). An overview of the results of the DQA is presented in Section 4.1. Statistical analysis of the RSDs for field and laboratory IS replicates are presented in Appendix D.1. The complete DQA analysis is presented in Appendix D.2 in the data validation reports. Laboratory Level IV reports are provided in Appendix D.4.

4.1 Data Quality

- The data validation process found no systematic problems but indicated exceedances of QC limits. A total of 22 (4.6 percent) of the 478 results (sample and field QC samples) were qualified as estimated based on data validation review (e.g., "J" [estimated value], "J-" [estimated value may be biased low], "J+" [estimated value may be biased high],or "UJ" [not detected, Limit of Detection (LOD) is an estimated value due to analyte-specific quality control issues]). There were no rejected results.
- Completeness, regarding the number of regular and field QC samples collected compared to the number of regular and field QC samples that were planned to be collected, was 100 percent.
- Completeness, regarding the number of regular and field QC analytical results that were determined to be usable, was 100 percent.
- Data validation determined that the overall accuracy, based on the percentage of matrix spike (MS) and matrix spike duplicate (MSD) samples that were within the established percent recovery (%R) control limits, was acceptable. Of the 478 sampling results, a total of 8 results (1.7 percent) were qualified as estimated based on minor exceedances of MS/MSD %R limits.
- Data validation determined that the overall accuracy, based on the percentage of laboratory control samples (LCS) that were within the established %R control limits, was acceptable. No results were qualified as estimated based on LCS %R limits.
- Data validation determined that the overall accuracy, based on the percentage of serial dilutions within the percent difference limits and post-digestion spike recoveries that were within the established %R control limits, was acceptable. Of the 478 sampling results, a total of 8 results (1.7 percent) were qualified as estimated based on minor exceedances of QC limits.

- Overall MS/MSD duplicate precision for all samples was acceptable. No results were qualified as estimated based on minor exceedances of MS/MSD Relative Percent Difference (RPD) precision limits.
- Overall LCS replicate (either duplicate or triplicate) precision for all samples was acceptable. Of the 478 sampling results, a total of 14 results (2.9 percent) were qualified as estimated based on exceedances of LCS RPD or RSD precision limits.
- Of the 47 calculated RSDs for field replicate samples, 49% (23) were within project DQOs, 30% (14) were greater than 30% but less than 50%, 15% (7) were greater than 50% but less than 100%, and 6.0% (3) were greater than 100%.
- Representativeness was evaluated by comparing preservation and analytical procedures to those described in the UFP-QAPP, by evaluating holding times, and by examining blanks for possible contamination of samples during collection and analysis. All samples were preserved, prepared, and analyzed following methods specified in the UFP-QAPP, except as noted in Section 3.3. Due to use of the puck mill grinding process, low levels of arsenic and manganese were detected in the method blanks. However, only three arsenic results (via method GFAA 7010) were qualified due to the reported results being less than five times the amount reported for the blank. Therefore, representativeness was achieved.
- Comparability refers to the confidence with which one data set can be compared to another. To improve data comparability, the data set used for sampling activities for the RI was generated by employing standardized sampling, analytical, and data validation procedures. Project planning, including laboratory selection, incorporated various appropriate USEPA guidance documents, as well as direct input from USACE on field, laboratory, and data screening issues to ensure the comparability of the data. Because of the implementation of standard and consistent planning, field, analytical, and validation procedures during this investigation, the site data can be compared with confidence to historical site data of acceptable data quality. Therefore, comparability was achieved.
- Use of the additional analytical method (GFAA 7010) for arsenic in soil ensured that analytical limits of detection (LODs) and limits of quantitation (LOQ) for soil were less than the PSLs. Therefore, the sensitivity of laboratory limits to screening level benchmarks was met.

4.2 Data Uncertainty

As with all datasets, a level of uncertainty is typically associated with the data and its usability. In order to reduce the data uncertainties and biases, field instrument calibration, sample collection, and laboratory analyses were conducted in accordance with the standard operating procedures as outlined in the UFP-QAPP. Additionally, laboratory analytical techniques have a degree of uncertainty associated with them. These uncertainties are documented by using data qualifiers to reflect the uncertainty of the measurement. The presence of "J, "J-", "J+", and "UJ" qualified data in this dataset reflect this uncertainty. A J flag indicates the reported result is estimated, but the direction of bias, if present, is not specified or known; a J- flag indicates that the reported result is likely biased low; and a J+ flag indicates that the reported result is likely biased high. Note that the estimated result totals, as provided in the data validation reports (Appendix D.1), did not include sample concentrations that were qualified as estimated by the laboratory (reported results that were less than the analytical LOQ, but greater than the DL).

Data that are flagged with "J" or "UJ" qualifiers have more measurement uncertainty surrounding them than do non-qualified data. However, they were deemed valid and usable for purposes of this RI and these uncertainties are not likely to affect the project conclusions.

RSD results that are greater than the project DQOs for replicate samples increase the uncertainty in the estimated mean of the replicate result. Of the 47 calculated RSDs for field replicate samples, 49% (23) were within project DQOs, 30% (14) were greater than 30% but less than 50%, 15% (7) were greater than 50% but less than 100%, and 6% (3) were greater than 100%. Of the 46 calculated laboratory replicate RSDs, 74% (34) were within the project DQOs and 26% were greater than the project DQOs. Based on the RSDs, ERT evaluated the field and laboratory sampling and preparation methods. No systematic field sampling or laboratory processing errors were identified. It is likely that the RSDs greater than the project DQOs are likely due to the non-parametric distribution of arsenic and manganese in soil which may be due to the ore sources of the contaminant metals. The presence of RSDs greater than project DQOs may increase the level of uncertainty with respect to the decisions made based on these data. To address the increased level of uncertainty and to minimize the false negative decision errors that might be associated with high RSDs, ERT used the non-parametric (Chebyshev) equation for calculating the 95% upper confidence limit of the mean (95% UCL) for arsenic and/or manganese for all replicate samples for which the RSD was greater than project DQOs for comparison to the project screening levels.

5.0 INVESTIGATION RESULTS

This section provides the results of the investigation sample analyses screened against the comparison criteria presented in Section 3. Analysis of the findings and what the results mean for this site are presented in detail in the Section 7.0 HHRA/SLERA.

Site-wide, soil samples were collected from 87 surfaces soil SUs and 87 subsurface soil SUs, and were analyzed for arsenic and manganese. Site sampling results were compared to the USEPA RSLs for residential soil, USEPA RSLs for industrial soil, BTAG screening levels, and BTVs.

Site-wide, arsenic was reported in 85 of 87 surface soil site SUs and in 83 of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for residential soil (0.68 mg/kg). Site-wide, arsenic was reported in 82 of 87 surface soil site SUs and in 75 of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for industrial soil (3.0 mg/kg). Site-wide, arsenic was reported in 61 of 87 surface soil site SUs and in 49 of 87 subsurface soil site SUs at concentrations greater than the BTV (7.8 mg/kg). Site-wide, no reported results for arsenic were greater than the BTAG standard for arsenic (330 mg/kg).

Site-wide, manganese was reported in 43 of 87 surface soil site SUs and in 18 of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for residential soil (300 mg/kg). Site-wide, manganese was reported in of ten surface soil site SUs and in two of 87 subsurface soil site SUs at concentrations greater than the USEPA RSL for industrial soil (13,000 mg/kg). Site-wide, manganese was reported in 60 of 87 surface soil SUs and 35 of 87 subsurface soil SUs at concentrations greater than the BTV (460.5 mg/kg). Site-wide, manganese was reported in 69 of 87 surface soil SUs and 50 of 87 subsurface soil SUs at concentrations greater than the BTAG screening level (330 mg/kg).

Where replicate samples were collected, the SU 95% UCL was compared to the screening criteria (see Appendix D.3). A summary of results for each DU is provided in Sections 5.1 through 5.4.

5.1 DU 1 Remaining Area (DU1 A and DU 1B)

Fifty-nine surface (DU 1A) and 59 subsurface (DU 1B) soil samples were collected from 59 DU 1 SUs and submitted for laboratory analysis of arsenic and manganese. Sampling results for DU 1 are summarized in Sections 5.1.1 and 5.2.2, and provided in Appendix D, Tables D.3-1 (DU 1A) and D.3-2 (DU 1B). Soil sampling results that are screened against the human health screening levels are shown in Appendix A, Figures 9a (northern portion of DU 1) and 9c (southern portion of DU 1). Soil sampling results that are screened against the ecological screening levels are shown in Appendix A, Figures 9b (northern portion of DU 1) and 9d (southern portion of DU 1).

5.1.1 DU 1A (Remaining Area Surface Soil)

Table 5-1 presents a summary of the number of SUs greater than screening levels for DU 1A. Arsenic was detected in all 59 surface soil SUs collected from DU 1A. Reported results for arsenic in DU 1 surface soil ranged from 0.38 mg/kg in the sample collected from DU1A-SU44R2 to 55.1 mg/kg in the sample collected from DU1A-SU18. Reported results for arsenic in DU 1 surface

soil were greater than the USEPA RSL for residential soil (0.68 mg/kg) in 57 of 59 SUs. Reported results for arsenic in DU 1 surface soil were greater than the USEPA RSL for industrial soil (3 mg/kg) in 54 of the 59 SUs. Reported results for arsenic in surface soil were greater than the BTV (7.8 mg/kg) in 38 of 59 SUs. No reported results for arsenic in DU 1 surface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all 59 SUs collected from DU 1A. Reported results for manganese in DU 1 surface soil ranged from 105 mg/kg (DU1A-SU44R3; 95% UCL 151 mg/kg)) to 27,700 mg/kg (DU1A-SU12). Reported results for manganese in DU 1 surface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in 23 of 59 SUs. Reported results for manganese in DU 1 surface soil were greater than the USEPA RSL for industrial soil (13,000 mg/kg) in four of 59 SUs. Reported results for manganese in surface soil were greater than the BTV (460.5 mg/kg) in 33 of 59 SUs. Reported results for manganese in DU 1 surface soil samples were greater than the BTAG screening level (330 mg/kg) in 42 of 59 SUs.

Table 5-1. Summary of Screening Results for DU 1A

Parameter	USEPA RSL for Residential Soil (mg/kg)	USEPA RSL for Industrial Soil (mg/kg)	BTV (mg/kg)	BTAG mg/kg	DU 1A Surface Soil (0-1 ft bgs)			
					# of SUs Exceeding RSL for Residential	# of SUs Exceeding RSL for Industrial Soil	# of SUs Exceeding BTV	# of SUs Exceeding BTAG
Arsenic	0.68	3	7.8	328	57	54	38	0
Manganese	900	13,000	460.5	330	23	4	33	42

Legend:

USEPA - U.S. Environmental Protection Agency

5.1.2 DU 1B (Remaining Area Subsurface Soil)

Table 5-2 presents a summary of the number of SUs greater than screening levels for DU 1B.

Arsenic was detected in all 59 subsurface soil SUs collected from DU1B. Reported results for arsenic ranged from 0.19 mg/kg in the sample collected from DU1B-SU48 to 38.9 mg/kg in the sample collected from DU1B-SU19. Reported results for arsenic were greater than the USEPA RSL for residential soil (0.68 mg/kg) in 55 of 59 subsurface soil SUs and greater than the USEPA RSL for industrial soil (3.0 mg/kg) in 51 of 59 subsurface soil SUs. Reported results for arsenic

in subsurface soil were greater than the BTV (7.8 mg/kg) in 34 of 59 SUs. No reported results for arsenic in DU 1 subsurface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all 59 subsurface soil SUs collected from DU1B. Reported results for manganese ranged from 57.6 mg/kg in the sample collected from DU1B-SU35 to 18,500 mg/kg in the sample collected from DU1B-SU37. Reported results for manganese in DU 1 subsurface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in nine of 59 subsurface soil SUs, greater than the USEPA RSL for industrial soil (13,000 mg/kg) in one of 59 SUs, greater than the BTV (460.5 mg/kg) in 19 of 59 SUs, and greater than the BTAG screening level (330 mg/kg) in 31 of 59 SUs.

Table 5-2. Summary of Screening Results for DU 1B

Parameter	USEPA RSL for Residential Soil (mg/kg)	USEPA RSL for Industrial Soil (mg/kg)	BTV (mg/kg)	BTAG mg/kg	DU 1B Subsurface Soil (1-2 ft bgs)			
					# of SUs Exceeding RSL for Residential Soil	# of SUs Exceeding RSL for Industrial Soil	# of SUs Exceeding BTV	# of SUs Exceeding BTAG
Arsenic	0.68	3	7.8	328	55	51	34	0
Manganese	900	13,000	460.5	330	9	1	19	31

5.2 DU2 Former IRP Shop Area (DU 2A and DU 2B)

Eighteen surface (DU 2A) and 18 subsurface (DU 2B) soil samples were collected from 18 DU 2 SUs and submitted for laboratory analysis of arsenic and manganese. The results are summarized below. Sampling results for DU 2 are also provided in Tables D.3-3 (DU 2A) and D.3-4 (DU 2B). Soil sampling results that are screened against the human health screening levels are shown in Appendix A, Figure10a. Soil sampling results that are screened against the ecological screening levels are shown in Appendix A, Figure 10b.

5.2.1 DU 2 A (Former IRP Shop Area Surface Soil)

Table 5-3 presents a summary of the number of SUs greater than screening levels for DU 2A.

Arsenic was detected in all 18 SUs collected from DU 2A. Reported results for arsenic ranged from 4.1 mg/kg in the sample collected from DU2A-SU01 to 96 mg/kg in the sample collected

from DU2A-SU07R3 (95% UCL 118.8 mg/kg). Reported results for arsenic in DU 2 surface soil were greater than the USEPA RSL for residential soil (0.68 mg/kg) in 18 of 18 surface soil SUs and greater than the USEPA RSL for industrial soil (3 mg/kg) in 18 of 18 surface soil SUs. Reported results for arsenic in surface soil were greater than the BTV (7.8 mg/kg) in 15 of 18 SUs. No reported results for arsenic in DU 2 surface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was also detected in all 18 SUs collected from DU 2A. Manganese values ranged from 179 mg/kg in the sample collected from DU2A-SU07 to 7,010 mg/kg in the sample collected from DU2A-SU12. Reported results for manganese in DU 2 surface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in 11 of 18 SUs. No reported results for manganese in DU 2 surface soil were greater than the USEPA RSL for industrial soil (13,000 mg/kg). Reported results for manganese in surface soil were greater than the BTV (460.5 mg/kg) in 17 of 18 SUs. Reported results for manganese in DU 2 surface soil samples were greater than the BTAG screening level (330 mg/kg) in 17 of 18 SUs.

5.2.2 DU2B (Former IRP Shop Area Subsurface Soil)

Table 5-4 presents a summary of the number of SUs greater than screening levels for DU 2B.

Arsenic was detected in all 18 SUs collected from DU 2B. Reported results for arsenic ranged from 2.1 mg/kg in the sample collected from DU2B-SU10 to 114 mg/kg in the sample collected from DU2B-SU06. Reported results for arsenic in DU 2 subsurface soil were greater than the USEPA RSL for residential soil (0.68 mg/kg) in 18 of 18 subsurface soil SUs and greater than the USEPA RSL for industrial soil (3 mg/kg) in 16 of 18 subsurface soil SUs. Reported results for

arsenic were greater than the BTV (7.8 mg/kg) in 12 of 18 SUs. No reported results for arsenic in DU 2 subsurface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all 18 SUs collected from DU 2B. Reported results for manganese ranged from 90.5 mg/kg in the sample collected from DU2B-SU02 to 1,960 mg/kg in the sample collected from DU2B-SU07. Reported results for manganese in DU 2 subsurface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in 3 of 18 SUs. No reported results for manganese in DU 2 subsurface soil were greater than the USEPA RSL for industrial soil (13,000 mg/kg). Reported results for manganese were greater than the BTV (460.5 mg/kg) in 9 of 18 SUs. Reported results for manganese in DU 2 subsurface soil samples were greater than the BTAG screening level (330 mg/kg) in 12 of 18 SUs.

5.3 DU 3 Former EC-57D Area (DU 3A and DU 3B)

Ten surface (DU 3A) and 10 subsurface (DU 3B) soil samples were collected from 10 DU 3 SUs and submitted for laboratory analysis of arsenic and manganese. The results are summarized below. Sampling results for DU 3 are also provided in Tables D.3-5 (DU 3A) and D.3-6 (DU 3B). Soil sampling results that are screened against the human health screening levels are shown in Appendix A, Figure11a. Soil sampling results that are screened against the ecological screening levels are shown in Appendix A, Figure 11b.

5.3.1 DU 3A (Former EC-57D Area Surface Soil)

Table 5-5 presents a summary of the number of SUs greater than screening levels for DU 3A.

Arsenic was detected in all 10 SUs collected from DU 3A. Reported results for arsenic ranged from 6.3 mg.kg in the sample collected from DU3A-SU07 to 28.6 mg/kg in the sample collected from DU3A-SU03. Reported results for arsenic in DU 3 surface soil were greater than the USEPA RSL for residential soil (0.68 mg/kg) and greater than the USEPA RSL for industrial soil (3.0 mg/kg) in 10 of 10 SUs. Reported results for arsenic in surface soil were greater than the BTV (7.8 mg/kg) in eight of 10 SUs. No reported results for arsenic in DU 3 surface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all 10 SUs collected from DU 3A. Reported results for manganese ranged from 867 mg/kg in the sample collected from DU3A-SU05 to 48,800 mg/kg in the sample collected from DU3A-SU04. Reported results for manganese in DU 3 surface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in nine of 10 SUs. Reported results for manganese in DU 3 surface soil were greater than the USEPA RSL for industrial soil (13,000 mg/kg) in six of 10 SUs. Reported results for manganese in surface soil were greater than the BTV (460.5 mg/kg) in 10 of 10 SUs. Reported results for manganese in DU 3 surface soil samples were greater than the BTAG screening level (330 mg/kg) in 10 of 10 SUs.

5.3.2 DU 3B (Former EC-57D Area Subsurface Soil)

Table 5-6 presents a summary of the number of SUs greater than screening levels for DU 3B.

Arsenic was detected in all 10 SUs collected from DU 3B. Reported results for arsenic ranged from 1.5 mg/kg in the sample collected from DU3B-SU06 to 66 mg/kg in the sample collected from SU3B-SU03. Reported results for arsenic in DU 3 subsurface soil were greater than the USEPA RSL for residential soil (0.68 mg/kg) in 10 of 10 SUs and greater than the USEPA RSL

for industrial soil (3 mg/kg) in 8 of 10 SUs. Reported results for arsenic in subsurface soil were greater than the BTV (7.8 mg/kg) in three of 10 SUs. No reported results for arsenic in DU 3 subsurface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all ten SUs collected from DU 3B. Reported results for manganese ranged from 89 mg/kg in the sample collected from DU3B-SU06 to 24,600 mg/kg in the sample collected from DU3B-SU04. Reported results for manganese in DU 3 subsurface soil were greater than the USEPA RSL for residential soil (900 mg/kg) in six of 10 SUs. Reported results for manganese in DU 3 subsurface soil were greater than the USEPA RSL for industrial soil (13,000 mg/kg) in one of 10 SUs. Reported results for manganese in subsurface soil were greater than the BTV in seven of 10 SUs. Reported results for manganese in DU 3 subsurface soil samples were greater than the BTAG screening level (330 mg/kg) in seven of 10 SUs.

5.4 Background (DU 4A and DU 4B)

Seven surface (DU 4A) and seven subsurface (DU 4B) soil samples were collected from seven background SUs and submitted for laboratory analysis of arsenic and manganese. The results are summarized below. Sampling results for DU 4 are also provided in Tables D.3-7 (DU 4A) and D.3-8 (DU 4B). Soil sampling results that are screened against the human health screening levels are shown in Appendix A, Figure12a. Soil sampling results that are screened against the ecological screening levels are shown in Appendix A, Figure 12b.

Note that background sampling results were used to derive the BTVs used for site soil sample comparisons.

5.4.1 Background Surface Soil (DU 4A)

Table 5-7 presents a summary of the number of SUs greater than screening levels for DU 4A.

Arsenic was detected in all seven surface soil SUs collected from DU 4A. Reported results for arsenic in surface soil ranged from 1.2 mg/kg in the sample collected from DU4A-SU05 to 3.5 mg/kg in the sample collected from DU4A-SU03. Reported results for arsenic were greater than the USEPA RSL for residential soil (0.68 mg/kg) in all SUs. The reported result for arsenic in DU4A-SU03 was greater than the USEPA RSL for industrial soil (3.0 mg/kg). No reported results for arsenic in background surface soil samples were greater than the BTAG screening level (328 mg/kg).

Manganese was detected in all seven surface soil SUs collected from DU 4A. Reported results for manganese in surface soil ranged from 85.9 (DU4A-SU06) to 334 mg/kg (DU4A-SU01). The reported results for manganese in DU4A-SU01 was greater than the BTAG screening level (330 mg/kg). No reported results for manganese in background surface soil samples were greater than the USEPA RSL for residential soil (900 mg/kg) or greater than the USEPA RSL for industrial soil (13,000 mg/kg).

5.4.2 Background Subsurface Soil (DU 4B)

Table 5-8 presents a summary of the number of SUs greater than screening levels for DU 4B.

Arsenic was detected in all seven subsurface soil SUs collected from DU 4B. Reported results for arsenic ranged from 0.81 J (DU4B-SU05) to 7.2 mg/kg (DU4B-SU01). All reported results for arsenic in the subsurface background soil exceeded the USEPA RSL for residential soil (0.68 mg/kg) and one reported result (DU4B-SU01) exceeded the USEPA RSL for Industrial Soil (3.0

mg/kg). No reported results for arsenic in background subsurface soil samples were greater than the BTAG screening level (330 mg/kg).

Manganese was detected in all seven SUs collected from DU 4B. Reported results for manganese ranged from 72.3 (DU4B-SU06) to 327 mg/kg (DU4B-SU03). No reported results for manganese in the subsurface background soil were greater than the USEPA RSL for residential soil (900 mg/kg), the USEPA RSL for industrial soil (13,000 mg/kg), or the BTAG screening level (330 mg/kg).

6.0 CONTAMINANT FATE AND TRANSPORT

Fate and transport mechanisms potentially affect the release and distribution of constituents. In order to completely characterize the site, an evaluation of the environmental fate and transport of constituents that were reported at concentrations exceeding the risk screening criteria was performed. As part of the RI, surface soil and subsurface soil were evaluated and detected constituents exceeding the risk screening criteria were evaluated for persistence in the environment and the potential for inter-media transfer and migration. The subsections detail the potential routes of constituent transport; estimate the persistence of identified constituents based on physical, chemical and biological factors affecting fate and transport; and predict migration routes.

6.1 Potential Contaminant Sources and Release Mechanisms

As presented in Section 3.1.1.2, the potential contaminant sources are the former DoD activities. Stockpiles of raw ores, some of which contained arsenic and/or manganese were stored throughout the Depot (Parsons, 1999). Arsenic and manganese also occur under natural conditions as a result of both chemical and physical weathering process on parent rock. However, the Depot was built on farmland (Parsons, 1999) and pesticides/herbicides were likely used. Pesticide/herbicides were reportedly used at the Depot around the railroad tracks, buildings, and ore stockpiles (Parsons, 1999). Although a complete list of activities performed at the Depot are unknown, the known potential contributors to arsenic and manganese in soil include:

- Ore stockpiles (arsenic and manganese);
- Anthropogenic sources (pesticide/herbicide use [arsenic], atmospheric deposition [arsenic and manganese]); and
- Natural sources.

6.2 Potential Contaminant Migration Pathways

Migration pathways from a source provide the route of transport for released chemicals to be transported across and between media. Migration pathways can be naturally occurring or man-made pathways. Historical DoD activities resulted in the downward migration of contaminants through possible downward infiltration/percolation of rainfall into the surface soils or horizontal migration through contaminated fugitive dust. Typically, surface and subsurface soil are not considered transport media, although if sufficiently impacted, may affect the final transportation and disposition of identified COPCs, and can result in groundwater becoming secondary sources of contamination. After migrating through the vadose zone, contaminants can then enter the groundwater where they may undergo hydrolysis, oxidation, reduction, or other processes resulting in the chemical transformation of a contaminant.

Site groundwater was sampled during the EC RI (ERT, 2016) and arsenic and manganese were not detected at concentration greater than the PSLs. This indicates that arsenic and manganese are not migrating to groundwater. Site surface water and sediment samples were collected from the unnamed tributary and analyzed confirming that arsenic and manganese are not migrating to the unnamed tributary. The EC RI (ERT, 2016) concluded that there were no unacceptable risks to human health or the environment from arsenic and/or manganese in surface water and/or sediment.

Constituents are also attenuated mechanically as they migrate through the subsurface by processes such as dilution, dispersion, diffusion, and absorption. Potential secondary release mechanisms include infiltration and/or percolation of water through contaminated subsurface soil.

Contaminated soil may also be tracked from one location to another; plant life may absorb soil contaminants; and, wildlife may ingest plants that have assimilated contaminants in leaf and stem tissue. In addition, contaminants can be conveyed by surface water and/or sediments to aquatic life that may be ingested by wildlife. Contaminants can also accumulate in a specific medium. The potential for specific contaminants to migrate from one medium to another or to be transformed is dependent on the physical and chemical properties of each contaminant.

Fate and transport physiochemical principals and characteristics of chemicals were used to evaluate site-specific analytical data in order to identify COPCs reported above the screening levels that have the potential to persist or migrate along potential transport pathways. Three pathways were evaluated; air transport, soil erosion, and surface water runoff. Previous groundwater sampling has confirmed that constituents have not contaminated groundwater.

Air transport of impacted soil is possible but considered unlikely due to the minimal amount of exposed soil at the site and the vegetation enclosing the site.

Offsite migration of COPCs via surface water and soil erosion in exposed areas is possible on a limited basis. Metals adhered to eroded soil may be transported via surface water. The heavier metal constituents typically sorb to clays and organic materials and precipitate out of groundwater. In addition, due to the predominantly aerobic and neutral pH conditions at the site, it is assumed that migration of arsenic is negligible.

6.2.1 Airborne Transport

Movement of surface soil particulates from impacted soils via atmospheric wind is a transportation pathway. Such particulate transport is generally limited due to particle size, wind speeds and other site-specific conditions. Contaminant transport via wind across the Depot is also possible. However, the surface soil generally consists of vegetation which tends to suppress erosion and the airborne transport of particulates. However, there are areas of the site (e.g., roadways) that are not overgrown with vegetation and provide potential air transport concerns.

6.2.2 Soil and Sediment Transport

Site conditions maintain the movement of surface water flow towards historical site features (i.e., drainage ditches). Soil and sediment deposits tend to accumulate in historic features such as drainage ditches and are ultimately deposited along with the surface water into the Chesapeake Bay.

6.2.3 Surface Water Transport

Surface water provides a potential critical pathway for constituents to migrate from a source area. Based on the typical topography associated with the site, characterized by relatively level grade surface and several man-made drainage features. Vegetation typically inhibits the erosion of soil

particles and very few areas at the site are devoid of ground surface grass and brush vegetation. During heavy rain events, sheet flow or overland flow of surface water may result in surface water draining into the nearest drainage ditch. Engineering of the various drainage ditches associated with the former Depot ultimately directs the surface water discharge into local streams, and ultimately the Chesapeake Bay.

Direct infiltration of surface water to the shallow groundwater can contribute to the migration of constituents. The overall low permeability at the former Depot inhibits surface water infiltration into the shallow groundwater.

6.3 Contaminant Persistence

The environmental fate and transport of chemicals are dependent upon the physical and chemical properties of the compounds, the environmental transformation processes affecting them, and the media through which they migrate.

Metal constituents were identified in soil above background concentrations and screening levels. The potential for transport of metal analytes in the subsurface is based upon analyte specific affinity to soil and groundwater. Factors affecting transport dynamics include soil-water chemistry and charge deficiency on adsorbent surfaces, such as soil and sediment. In order to neutralize the surface charge, an accumulation of ions near the soil-groundwater interface is required. Factors including soil texture, soil chemistry, pH and redox potential also enhance or diminish the mobility of a metal analyte. Typically, the solubility of metals tends to increase proportional to increased acidity, and conversely under alkaline conditions.

There are numerous natural materials that strongly interact with water. Metal sorption is affected primarily by physical and chemical processes. Generally, the sorption coefficient for a metal is indicative of the relative affinity of a metal to soil, and ultimately the immobility of the metal. Physical adsorption is due to surface charges which attract ionic species of the opposite charge. Hydrous oxides may also promote the sorption of metals. Metal ions sorbed to these surfaces become precipitated with the hydrous oxides. Chemical processes for adsorption include ion exchanges, precipitation, solid-state diffusion and isomorphic substitution. Organic matter may also result in metals sorbing to soil and sediment making them insoluble in groundwater.

6.3.1 Arsenic

Arsenic is a widely distributed naturally occurring element occurring in soil and minerals. Arsenic may enter air, water and land through wind-blown dust and water run-off. Arsenic in the atmosphere comes from various sources, including volcanoes and microorganisms, however human activity is responsible for release through the burning of fossil fuels. In industry, arsenic is a byproduct of the smelting process (separation of metal from rock) for many metal ores. Due to human activities, mainly through mining, naturally immobile arsenics have also mobilized and can now be found in many more places than where they existed naturally (Risk Assessment Information System [RAIS], 2019b).

During the 18th, 19th, and 20th centuries, several arsenic compounds have been used as medicine. In the 19th Century, arsenic was used in paints and dyes for clothes, paper, and wallpaper. Arsenic compounds are used in making special types of glass, as a wood preservative and, more recently, in semiconductors. In the more recent past (early 20th century) arsenic was used in insecticides such as ant killers and animal dips. However, regulatory restrictions for arsenic, especially for home products, have reduced its use and the exposure to it.

Production of wood preservatives, primarily copper chromated arsenate (CCA), accounted for more than 90% of domestic consumption of arsenic trioxide in 2003. Wood treated with CCA is known as "pressure treated wood". In 2002, the USEPA reached an agreement with the manufacturers of wood preservative products containing CCA to cancel the registration of CCA for use in virtually all residential applications. However, wood treated prior to this date can still be used, and CCA-treated wood products continue to be used in industrial applications. Organoarsenic compounds have been used as chemical weapons, especially during World War I.

Arsenic appears in three allotropic forms: yellow, black and grey; the stable form is a silver-gray, brittle crystalline solid. Arsenic tarnishes rapidly in air, at high temperatures burns forming a white cloud of arsenic trioxide, and combines readily with many other elements. In the environment, arsenic combines with oxygen, chlorine, and sulfur to form inorganic arsenic compounds. Arsenic in animals and plants combines with carbon and hydrogen to form organic arsenic compounds. The most common forms of arsenic in groundwater are their oxy-anions, arsenite (As+3) and arsenate (As+5). Under moderately reducing conditions, arsenite is the predominant species. In oxygenated water, arsenate is the predominant species. Both anions are capable of adsorbing to various subsurface materials, such as ferric oxides and clay particles. Ferric oxides are particularly important to arsenate fate and transport as ferric oxides are abundant in the subsurface and arsenate strongly adsorbs to these surfaces in acidic to neutral waters. An increase in the pH to an alkaline condition will cause both arsenite and arsenate to desorb, and they can be expected to be very mobile in an alkaline environment. The arsenic oxy-anions are also sensitive to redox conditions, and the speciation differential between them will change with changing redox.

Elemental arsenic is extremely persistent in both water and soil. Environmental fate processes may transform one arsenic compound to another; however, arsenic itself is not degraded. Soluble forms of arsenic tend to be quite mobile in water, while less soluble species adsorb to clay or soil particles. Microorganisms in soils, sediments, and water can reduce and methylate arsenic to yield methyl arsines, which volatilize and enter the atmosphere. These forms then undergo oxidation to become methyl arsonic acids and are ultimately transformed back to inorganic arsenic. Fish and shellfish can accumulate arsenic, but the arsenic in fish is mostly in a form that is not harmful. Bioconcentration of arsenic occurs in aquatic organisms, primarily in algae and lower invertebrates. Biomagnification in aquatic food chains does not appear to be significant, although some fish and invertebrates contain high levels of arsenic compounds which are relatively inert toxicologically. Plants may accumulate arsenic, subject to various factors including soil arsenic

concentration, plant type, and soil characteristics (Agency for Toxic Substances & Disease Registry [ATSDR], 2007).

The toxicity of inorganic arsenic depends on its valence state and on the physical and chemical properties of the compound in which it occurs. Water soluble inorganic arsenic compounds are absorbed through the gastrointestinal tract and lungs; distributed primarily to the liver, kidney, lung, spleen, aorta, and skin; and excreted mainly in the urine. Symptoms of acute inorganic arsenic poisoning in humans are nausea, anorexia, vomiting, epigastric and abdominal pain, and diarrhea. While persistent in the soil, the pathway exists for future migration of arsenic from subsurface soil to the groundwater. The mobility of arsenic is limited because it strongly sorbs to soil particles and does not readily enter the groundwater. As previously mentioned in Section 6.2., previous groundwater sampling has confirmed that arsenic has not contaminated groundwater.

6.3.2 Manganese

Manganese is a silver-colored, naturally occurring metal that makes up approximately 0.1 percent of the Earth's crust and is present in many geologic formations. Manganese is an essential trace element and is necessary for good health. Normal nutritional requirements of manganese are satisfied through the diet, which is the normal source of the element, with minor contributions from water and air. Environmental manganese readily combines with other substances and is not found isolated in the environment. Manganese is also utilized in industrial processes to produce carbon-based organic manganese compounds such as pesticides and methylcyclopentadienyl manganese tricarbonyl (MMT), a fuel additive in some gasolines (RAIS, 2019b). MMT is a manganese-containing compound used to enhance the octane rating in gasoline. MMT was used as an additive in leaded gasoline until the phase-out of leaded gas in the United States in 1995. It was also used in unleaded gasoline for a short period of time in the late 1970s but was banned as an additive in unleaded gasoline by USEPA in 1977. In 1995, the ban on MMT use in unleaded gasoline was lifted, and a court decision ordered USEPA to register the product for use as a fuel additive, although testing for health effects continues.

Manganese is pervasive in the environment, occurring naturally in more than 100 minerals with background levels in soil ranging from 40 to 900 mg/kg, with an estimated mean background concentration of 330 mg/kg. Background levels of manganese in the atmosphere vary widely depending on proximity of point sources.

Manganese releases to the environment from industrial emissions, fossil fuel combustion, volcanic eruptions and erosion of manganese-containing soil. The principal sources of industrial emissions are ferroalloy production and iron and steel foundries, and the principal sources of combustion emissions are power plants and coke ovens. Almost 80 percent of industrial emissions of manganese are attributable to iron and steel production facilities. While power plant and coke oven emissions contribute about 20 percent of industrial emissions of manganese. Manganese may also be released to the environment during combustion of the gasoline additive MMT. Windblown erosion of dusts and soils is also an important atmospheric source of manganese.

Atmospheric emissions of manganese and other trace metals from these industrial sources have declined over the last two decades due to the use of advanced pollution control devices and increased government regulations regarding these emissions.

Manganese compounds have negligible vapor pressures but may exist in air as suspended particulate matter derived from industrial emissions or the erosion of soils. Manganese-containing particles are mainly removed from the atmosphere by gravitational settling, with large particles tending to fall out faster than small particles. The half-life of airborne particles is usually on the order of days, depending on the size of the particle and atmospheric conditions. Some removal by washout mechanisms such as rain may also occur, although it is of minor significance in comparison to dry deposition.

There are two mechanisms involved in explaining the retention of manganese and other metals in the environment by soil. First, through cation exchange reactions, manganese ions and the charged surface of soil particles form manganese oxides, hydroxides, and oxyhydroxides, which in turn form absorption sites for other metals. Secondly, manganese can be adsorbed to other oxides, hydroxides, and oxyhydroxides through ligand exchange reactions. When the soil solution becomes saturated, these manganese oxides, hydroxides, and oxyhydroxides can precipitate into a new mineral phase and act as a new surface to which other substances can absorb (Evans, 1989).

The transport of manganese in air is largely determined by its particle size. About 80 percent of the manganese in suspended particulate matter is associated with particles having a mass median aerodynamic diameter less than 5 µg. The compound's small particle size favors widespread airborne distribution and is within the respirable range.

The transport and partitioning of manganese in water is controlled by the solubility of the specific chemical form present, which in turn is determined by pH, Eh (oxidation-reduction potential), and the characteristics of the available anions. The metal may exist in water in any of four oxidation states; however, Mn(II) predominates in most waters (pH 4–7), but may become oxidized under alkaline conditions at pH >8. The principal anion associated with Mn(II) in water is usually carbonate (CO3–2), and the concentration of manganese is limited by the relatively low solubility (65 mg/L) of manganese carbonate. Under oxidizing conditions, the solubility of Mn(II) may be controlled by manganese oxide equilibria, with manganese being converted to the Mn(II) or Mn(IV) oxidation states. In extremely reduced water, the fate of manganese tends to be controlled by formation of a poorly soluble sulfide (USEPA,1984).

Manganese is often transported in rivers as suspended sediments. Manganese in water may be significantly bioconcentrated at lower trophic levels. The tendency of soluble manganese compounds to adsorb to soils and is dependent upon the cation exchange capacity and the organic composition of the soil. Manganese can react with sulfur dioxide and nitrogen dioxide, but the occurrence of such reactions in the atmosphere has not been demonstrated. Manganese in water may undergo oxidation at high pH and is also subject to microbial activity. The microbial metabolism of manganese is presumed to be a function of pH, temperature, and other factors. The oxidation state of manganese in soils and sediments may be altered by microbial activity. As

previously mentioned in Section 6.2, previous groundwater sampling has confirmed that manganese has not contaminated groundwater.

7.0 BASELINE RISK ASSESSMENT FOR ARSENIC AND MANGANESE

The baseline risk assessments for this RI include both an HHRA and a SLERA. The objectives for the baseline risk assessments were to

- determine the potential risks posed to human health and the environment from arsenic and manganese detected at the DUs investigated for the Curtis Bay RI; and
- to support the determination of remediation alternatives for mitigation of potential risks at each individual DU, including no action.

The data used to support the Baseline Risk Assessment include surface and subsurface soil. All data results are provided in the DU-specific subsections below. The preliminary CSMs are detailed in Section 3.1.1. The HHRA and SLERA are provided in the following subsections. The supporting HHRA tables and SLERA site visit memorandum are provided in Appendix B.

7.1 Human Health Risk Assessment

This section provides the characterization of the potential risks estimated for identified exposure pathways. Risk characterization integrates the estimated exposure information for site receptors with the representations of the potential toxicity derived for each COPC. Using standard USEPA-recommended approaches, this integration yields quantitative estimates of theoretical excess cancer and non-cancer risk for site-related COPCs (i.e., arsenic and manganese).

The soil data were screened against RSLs for residential soil (USEPA, 2020b) to support the alternative selections in the FS. The data for each of the three DUs also were compared to site-specific background soil data collected for this RI/FS from an area unimpacted by activities at the Depot (designated DU 4) to help further determine the need for remedial action. As the concentrations of arsenic and manganese in both surface and subsurface soil exceeded USEPA RSLs for residential soil, an HHRA was conducted for all three DUs (Appendix B, Attachments B.1-A, -B, and -C). Surface soil (0-1 ft bgs) and combined surface/subsurface soil (0-2 ft bgs) from DU 1, DU 2, and DU 3 were evaluated separately for risk-based decision-making purposes. Background conditions also were evaluated (Appendix B, Attachment B.1-D).

This HHRA complies with the CERCLA, as amended by the Superfund Amendments and Reauthorization Act (SARA) and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), and with the relevant guidance published in support of these regulations. It also is consistent with and guided by the CSM included in Section 3.1.1 and the approved UFP-QAPP (ERT, 2019), and as updated in this report (Section 8.0).

7.1.1 Screening to Identify COPCs

The analytical data for arsenic and manganese in surface and subsurface soil samples collected in March and April 2019 were screened to determine whether the concentrations exceed conservative health-based screening criteria. While industrial RSLs and criteria published by the USEPA Region III Biological Technical Assistance Group (BTAG) were considered, the residential RSLs are more conservative and, therefore, were selected as the criteria for determining protection to a cancer risk level of 1×10^{-6} (for arsenic) and a non-cancer hazard quotient (HQ) of 0.5 (for arsenic

and manganese) (USEPA, 2020b). The HQ of 0.5 was used because there are only two contaminants under consideration for this RI. Correspondingly, the target screening values are 0.68 mg/kg for arsenic and 900 mg/kg for manganese (Appendix B, Table B.1-2 for each of the DUs in Attachments A, B, and C).

The screening process is summarized in tables that follow guidance given in RAGS Part D (USEPA, 2001a), with a separate set of tables generated for DU 1 (Appendix B, Attachment A), DU 2 (Appendix B, Attachment B), and DU 3 (Appendix B, Attachment C). Background values in surface and subsurface soil were generated from ProUCL analysis of soil data from DU 4 (Appendix B, Attachment F), with the 95% UCLs used as the representative values of arsenic and manganese in background soil (Appendix B, Attachment D).

Metadata were generated for arsenic and manganese for each of the three DUs, including the minimum and maximum detected concentrations, location of each maximum concentration, and frequency of detection in surface soil and combined surface/subsurface soil (Appendix B, Tables B.1-2a and -2b of Attachments A, B, and C). The maximum concentrations were used as screening values and compared to the RSL screening values. As the maximum concentrations of arsenic and manganese at each of the three DUs exceeded the residential RSLs, both metals were identified as COPCs (USEPA, 2020b). As such, both arsenic and manganese were carried through a quantitative baseline HHRA for each of the three DUs (Attachments A, B, and C).

Both metals were detected in background soils (DU 4), as expected. Both arsenic and manganese in DU 4 were carried through a quantitative baseline HHRA, as described in the following sections.

7.1.2 Exposure Assessment

Exposure assessment involves integrating knowledge of the site and its characteristics with the potential for exposure to contaminated media by human receptors along complete exposure pathways (Section 3.1.1). In so doing, quantitative estimates of the type, magnitude, and duration of exposures to the COPCs can be generated (USEPA, 2001a).

7.1.2.1 Exposure Pathways

The CSM (Section 3.1.1) identified the following receptors and scenarios for each of the three DUs and for which quantitative exposure assessment was performed.

Surface Soil (0-1 ft)

- Site Worker (Current/Future)
- Construction Worker (Future)
- Resident Adult (Potential Future)
- Resident Child (Potential Future)

Combined Surface and Subsurface Soil (0-2 ft)

- Construction Worker (Future)
- Resident Adult (Potential Future)

- Resident Child (Potential Future)

In addition, trespassers are expected to be exposed to surface soil but with less exposure frequency than for site workers.

7.1.2.2 Exposure Point Assessment

The exposure point concentration (EPC) is a conservative estimate of the average concentration of a COPC to which a receptor may be exposed at a given site and typically is either the maximum detected concentration or the 95% UCL of the mean concentration. The 95% UCL was calculated for surface soil and combined surface/subsurface soil for each of the three DUs using USEPA's ProUCL 5.1 software (Appendix B, Attachment F). For each DU, the software indicated the data for both metals were normally distributed at a 5% significance level. The 95% UCL values were lower than the maximum concentrations detected in each of the two soil intervals at the three DUs; regardless, the ISM document specifies that the 95% UCL, rather than the maximum concentration, is to be used as the EPC with ISM data (ITRC, 2012). The recommended 95% UCLs therefore were used as the EPCs (Appendix B, Tables B.1-3a and -3b of Attachments A, B, and C).

EPCs for COPCs in airborne fugitive dust are based on soil EPCs (USEPA, 2009) and were estimated using the following equation:

$$C_{air} = C_{soil}/PEF$$

where

C_{air} = COPC concentration in air at the exposure point (milligram per cubic meter [mg/m^3])

C_{soil} = COPC exposure point concentration soil (milligram per kilogram [mg/kg])

PEF = particulate emission factor (cubic meter per kilogram [m^3/kg])

The PEF relates the concentration of the soil COPC to its concentration in the dust particles in the air. This calculation addresses dust generated from open sources, termed "fugitive" because it is not discharged into the atmosphere in a confined flow. The USEPA's default PEF of 4.63E+09 m3/kg was used for the determination of the COPC concentration in air using soil data (Appendix B, Tables B.1-4a, -4b, -4c, and -4d of Attachments A, B, and C).

Exposure assumptions and default values provided by USEPA were used for scenarios involving site workers, construction workers, and future adult and child residents (Appendix B, Tables B.1-4a, -4b, -4c, and -4d, respectively, in Attachments A, B, and C for each of the three DUs). As site workers would have greater exposure frequency to surface soils (250 days per year) than would trespassers (52 days per year), the potential risks for trespassers are captured by the quantitative analysis of exposure by site workers.

7.1.2.3 Exposure Factors and Equations

Reasonable maximum exposures (RMEs) were calculated for site workers, construction workers, and future residents (adults and children) to focus the HHRA on conservative exposures that represent the maximum exposure that is reasonably expected to occur (USEPA, 1989). The most recent exposure factors recommended by USEPA (USEPA, 2011 and 2014) were used (Appendix B, Tables B.1-4a, -4b, -4c, and -4d of Attachments A, B, and C).

To estimate COPC intakes for each of the pathways considered in the HHRA, the exposure factors are combined with the EPCs (Section 7.1.2.2). The generic equation to calculate chronic daily intake (CDI) by ingestion is:

$$\text{CDI via Ingestion Route} = CS \times IR \times FI \times EF \times ED \times CF / (BW \times AT)$$

where

CS = Chemical Concentration in Soil (mg/kg)
IR = Incidental Soil Ingestion Rate (mg/day)
FI = Faction Ingested (unitless)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (Years)
CF = Conversion Factor (1E-6 for kg/mg)
BW = Body Weight (kg)
AT = Averaging Time (days)

The generic equation to calculate dermal intake is:

$$\text{CDI via Dermal Route} = CS \times SA \times AF \times DA \times CF \times EF \times ED / (BW \times AT)$$

where

CS = Chemical Concentration in Soil (mg/kg)
SA = Surface Area for Contact (cm^2)
AF = Adherence Factor (mg/cm^2)
DA = Dermal Absorption Fraction (unitless), chemical-specific (0.03 for arsenic and 0.01 for manganese (USEPA 2004))
EF = Exposure Frequency (days/year)
ED = Exposure Duration (Years)
CF = Conversion Factor (1E-6 for kg/mg)
BW = Body Weight (kg)
AT = Averaging Time (days)

The generic equation to calculate the air EC for the inhalation pathway is:

$$EC = Cair \times ET \times EF \times ED / AT$$

where

C_{air} = Chemical Concentration in Air (mg/m^3)

ET = Exposure Time (hours over 24-hour day)

EF = Exposure Frequency (days/year)

ED = Exposure Duration (Years)

AT = Averaging Time (days)

7.1.3 Toxicity Assessment

For toxicity assessment, the available evidence of the potential for COPCs to cause adverse health effects to receptors is used to estimate the extent to which exposure may increase the likelihood or severity of adverse effects (USEPA, 1989). Both arsenic and manganese present potential non-cancer hazards; potential carcinogenic effects are limited to arsenic only (i.e., manganese is not a known human carcinogen).

The reference dose (RfD) and reference concentration (RfC) for a given COPC are estimates of a daily oral exposure and continuous inhalation exposure, respectively, to the human population that are likely to be without deleterious effects during a lifetime; both are USEPA's preferred toxicity values for evaluating non-carcinogenic effects (USEPA, 2001a). Cancer slope factors (CSFs) are used to estimate the risk of cancer associated with daily oral and dermal exposure to a carcinogen or potential carcinogen. The inhalation unit risk (IUR) is the excess lifetime cancer risk estimated to result from continuous exposure to a carcinogenic agent at a concentration of 1 ug/m^3 in air for a lifetime (USEPA, 2020a).

RfDs and RfCs for arsenic and manganese, and CSFs and IURs for arsenic, were used to estimate the potential health risks for exposure at each DU (Appendix B, Tables B.1-5a and -5b of Attachments A, B, and C). These values were obtained from the following sources:

- USEPA's Risk Assessment Guidance for Superfund, Part E (USEPA, 2004)
- USEPA's RSL Table (USEPA, 2020b)

Dermal reference doses and dermal cancer slope factors were estimated from oral values (USEPA, 2004). Specifically, oral reference doses were converted to dermal reference doses by multiplying by the ABSGI as:

$$RfDdermal = RfDoral \times ABSGI$$

where

RfDdermal = dermally adjusted reference dose (mg/kg-day)

RfDoral = oral reference dose (mg/kg-day)

ABSGI (unitless) = gastro-intestinal absorption factor, chemical-specific

Oral cancer slope factors were converted to dermal slope factors by dividing by ABSGI, as:

$$CSFdermal = CSForal / ABSGI$$

where

CSFdermal = dermally adjusted cancer slope factor (mg/kg-day)-1

CSForal = oral slope factor (mg/kg-day)-1

ABSGI (unitless) = gastro-intestinal absorption factor, chemical specific

For the inhalation pathway, the inhalation chronic toxicity factors derived by USEPA (i.e., IURs and RfCs) were expressed as air concentrations. Air concentrations, derived as described previously (Section 5.2), were compared to inhalation toxicity factors rather than daily inhalation rates being converted to internal doses (i.e., mg/kg-day), for comparison (USEPA, 1996a).

7.1.3.1 Non-Cancer Hazards

The potential human health risks associated with exposures to non-carcinogenic COPCs (i.e., arsenic and manganese) were estimated by comparing the non-carcinogenic average chronic daily intake (CDI) with the chemical-specific RfD. An HQ was derived for each COPC, as given in the following equation:

$$HQ = CDI / RfD$$

where

HQ (unitless) = non-cancer hazard quotient

RfD (mg/kg-day) = oral or dermal reference dose for the chemical by the ingestion or dermal pathways

CDI (mg/kg-day) = Intake = estimated average chronic daily intake of the chemical via ingestion or dermal exposure

If the CDI exceeds the RfD, the HQ will exceed a ratio of one (1.0), indicating that the potential exists for adverse non-cancer health effects to occur in the exposed populations. If the CDI does not exceed the RfD, the HQ will not exceed one, indicating that it is unlikely that potential adverse health effects would be observed in the exposed populations.

For inhalation:

$$HQ = EC / RfC$$

where

HQ (unitless) = non-cancer hazard quotient

RfC (mg/m^3) = reference air concentration

EC (mg/m^3) = Intake = air exposure concentration

The CDI and EC were calculated for each exposure route (Appendix B, Tables B.1-4a, -4b, -4c, and -4d of Attachments A, B, and C). The total potential non-carcinogenic hazard (that is, the hazard associated with exposure to all COPCs by all exposure routes) is determined by summing the HQs for all non-carcinogenic COPCs to derive a total hazard index (HI) for each receptor. An HI of one (1.0) was used when evaluating total non-carcinogenic hazards for each receptor.

Chemical-specific HQs were then calculated to determine if any single COPC results in unacceptable total HIs. Finally, the target organs or toxic endpoints of each COPC were identified based on the critical toxicity study that was used to develop the non-cancer RfD or RfC (Appendix B, Table B.1-5a of Attachments A, B, and C). Target organs (or toxic endpoints) of the non-carcinogenic COPCs include the cardiovascular system and skin for arsenic, and the central nervous system for manganese. An HI of one (1.0) is used when evaluating total non-carcinogenic hazards and/or total target organ hazards for each receptor.

Detailed inputs and calculations for the non-cancer hazards that may be associated with the COPCs for the four potential current/future soil receptors (i.e., site worker, construction worker, adult resident, and child resident) then were performed for each of the three DUs (Appendix B, Tables B.1-6a through -12a of Attachments A, B, and C). Similar calculations were performed for DU 4 (background) as a means of comparison with the three DUs at the Depot (Appendix B, Table B.1-6a through -12a of Attachment D).

7.1.3.2 Carcinogenic Risks

The carcinogenic risks potentially posed by COPCs via ingestion or dermal exposure to a receptor were calculated using the following equation:

$$\text{Risk} = \text{CDI} \times \text{CSF}$$

where

Risk = carcinogenic risk posed by the chemical through the pathway

CSF = cancer slope factor for the chemical by that pathway (i.e., ingestion and dermal pathways)

CDI = Intake = the chronic daily intake of the chemical via ingestion or dermal exposure

For inhalation, the risks were calculated using the following equation:

$$\text{Risk} = \text{IUR} \times \text{EC}$$

where

IUR $(\mu g/m^3)^{-1}$ = inhalation unit risk

EC $(\mu g/m^3)$ = Intake = air exposure concentration

Arsenic is the COPC with carcinogenic risk. Detailed inputs and calculations for the carcinogenic risk that may be associated with exposure to arsenic by the four potential current/future human receptors (i.e., site worker, construction worker, adult resident, and child resident) were performed for each of the three DUs (Appendix B, Tables B.1-6b through -12b of Attachments A, B, and C). These estimated risks were compared to the acceptable incremental cancer risk of $1x10^{-5}$ specified by the MDE. Similar calculations were performed for DU 4 (background) as a means of comparison with the three DUs on the Depot property (Appendix B, Tables B.1-6b through -12b of Attachment D).

7.1.4 Risk Characterization

This section provides a characterization of the potential risks estimated for identified exposure pathways. Risk characterization integrates the estimated exposure information for site receptors with the representations of the potential toxicity derived for each COPC. Using standard USEPA-recommended approaches, this integration yields quantitative estimates of theoretical excess non-cancer and cancer risk for site-related COPCs (i.e., arsenic and manganese).

Risk estimates are calculated for individual COPCs for the complete exposure pathways associated with each assessed area (Sections 3.1.1 and 7.1.2). Per USEPA guidance, risk characterization also includes combining COPC-specific risk estimates across complete exposure pathways to provide overall characterizations of potential site-related risks. The risk characterization step integrates the exposure and toxicity assessments to derive quantitative estimates of total combined risk.

Risk characterizations were performed for surface soil and combined surface/subsurface soil for DU 1, DU 2, and DU 3 (Appendix B, Tables B.1-6a through -12c of Attachments A, B, and C). Summary information and key findings for each DU are presented in the following paragraphs. Similar characterization was made for DU 4 (background) (Appendix B, Tables B.1-6a through -12c of Attachment D).

7.1.4.1 Decision Unit 1 (DU 1)

Estimated Non-Cancer Hazards

Total non-carcinogenic HIs were calculated for all human receptors that potentially could be exposed to surface and combined surface/subsurface soil at DU 1 (Tables B.1-6a and -6c through B.1-12a and -12c of Attachment A). Among all the exposure scenarios evaluated, total non-carcinogenic HIs exceed 1.0 only for the future resident child scenarios (Tables B.1-9a, -9c, -12a, and -12c of Attachment A).

- For the future resident child scenario of exposure to surface soil at DU 1, the total HI is 3.0 (Tables B.1-9a and -9c of Attachment A).
  - The total HQ for manganese (2.8) and the HQ for manganese via the dermal exposure route to the resident child (1.9) both exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future resident child scenario of exposure to combined surface/subsurface soil at DU 1, the total HI is 1.9 (Appendix B, Tables B.1-12a and -12c of Attachment A).
  - The total HQ for manganese (1.7) and the HQ for manganese via the dermal exposure route to the resident child (1.2) both exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.

Estimated Carcinogenic Risks

Estimated carcinogenic risks were calculated for all human receptors potentially exposed to surface soil and combined surface/subsurface soil at DU 1 (Tables B.1-6b and -6c through B.1-

12b and -12c of Attachment A). The calculations were performed only for arsenic as manganese is not a known human carcinogen. Among all the exposure scenarios evaluated, there are no estimated carcinogenic risks above the acceptable incremental risk of $1x10^{-5}$ specified by MDE (Appendix B, Table B.1-9b and -c of Attachment A). The cumulative carcinogenic risk data indicate that arsenic in surface or subsurface soil at DU 1 is within the acceptable risk for all potential human receptors.

7.1.4.2 Decision Unit 2 (DU 2)

Estimated Non-Cancer Hazards

Total non-carcinogenic HIs were calculated for human receptors that potentially could be exposed to surface and combined surface/subsurface soil at DU 2 (Tables B.1-6a and -6c through B.1-12a and -12c of Attachment B). Among all the exposure scenarios evaluated, total non-carcinogenic HIs exceed 1.0 only for the future resident child scenarios (Tables B.1-9a, -9c, -12a, and -12c of Attachment B).

- For the future resident child scenario of exposure to surface soil at DU 2, the total HI is 2.0 (Tables B.1-9a and -9c of Attachment B).
  - The total HQ for manganese (1.3) exceeds 1.0, while the HQ for manganese via the dermal exposure route to the resident child (0.87) is less than 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future resident child scenario of exposure to combined surface/subsurface soil at DU 2, the total HI is 1.5 (Tables B.1-12a and -12c of Attachment B).
  - No individual exposure routes for manganese exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.

Estimated Carcinogenic Risks

Estimated carcinogenic risks were calculated for all human receptors potentially exposed to surface soil and combined surface/subsurface soil at DU 2 (Appendix B, Tables B.1-6b and -6c through B.1-12b and -12c of Attachment B). Among all the exposure scenarios evaluated, there are no estimated carcinogenic risks for site workers or construction workers above the acceptable incremental risk of $1x10^{-5}$; however, for future residents (both adult and child), estimated carcinogenic risks exceed the acceptable risk for exposure to both surface soil and subsurface soil (Appendix B, Tables B.1-8b, -8c, -9b, -9c, -11b, -11c, -12b, and -12c of Attachment B).

- For the future resident adult scenario of exposure to surface soil (Appendix B, Tables B.1-8b and -8c of Attachment B), the estimated carcinogenic risk for arsenic is $1.4x10^{-5}$, which exceeds the acceptable incremental risk specified by MDE. The carcinogenic risk through individual exposure pathways did not exceed this incremental risk limit.
- For the future resident child scenario of exposure to surface soil (Appendix B, Tables B.1-9b and -9c of Attachment B), the estimated carcinogenic risk for arsenic was $3.0x10^{-5}$, which exceeds the acceptable incremental risk specified by MDE. The carcinogenic risk

through the incidental ingestion exposure pathway ($2.3x10^{-5}$) also exceeds this incremental risk limit.

- For the future resident adult scenario to combined surface/subsurface soil (Appendix B, Tables B.1-11b and -11c of Attachment B), the estimated carcinogenic risk for arsenic is $1.3x10^{-5}$, which exceeds the acceptable incremental risk specified by MDE. The carcinogenic risk through individual exposure pathways did not exceed this incremental risk limit.
- For the future resident child scenario of exposure to combined surface/subsurface soil (Appendix B, Tables B.1-12b and -12c of Attachment B), the estimated carcinogenic risk for arsenic is $2.8x10^{-5}$, which exceeds the acceptable incremental risk specified by MDE. The carcinogenic risk through the incidental ingestion exposure pathway ($2.2x10^{-5}$) also exceeds this incremental risk limit.

7.1.4.3 Decision Unit 3 (DU 3)

Estimated Non-Cancer Hazards

Total non-carcinogenic HIs were calculated for all human receptors that potentially could be exposed to surface and combined surface/subsurface soil at DU 3 (Appendix B, Tables B.1-6a and -6c through B.1-12a and -12c of Attachment C). The estimated non-carcinogenic HIs exceed 1.0 for exposure to both surface soil and subsurface soil for all evaluated scenarios (Appendix B, Tables B.1-6a, -6c, -7a, -7c, 8a, -8c, 9a, -9c, -11a, -11c, -12a, and -12c of Attachment C).

- For current and future site worker scenarios of exposure to surface soil (Tables B.1-6a and -6c of Attachment C), the total HI is 1.4.
  - The non-cancer HQs for manganese via the dermal exposure route (1.1) exceeds 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future construction worker scenario of exposure to surface soil (Tables B.1-7a and -7c of Attachment C), the total HI is 2.1.
  - The non-cancer HQs for manganese via the dermal exposure route (1.1) exceeds 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future resident adult scenario of exposure to surface soil (Tables B.1-8a and -8c of Attachment C), the total HI is 2.1.
  - The non-cancer HQs for manganese via the dermal exposure route to adult (1.6) exceeds 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future resident child scenario of exposure to surface soil (Tables B.1-9a and -9c of Attachment C), the total HI is 13.8.
  - The non-cancer HQ for manganese via incidental ingestion route (3.9) and the non-cancer HQ for manganese via the dermal exposure route (9.3) both exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.

- For the future resident adult scenario to combined surface/subsurface soil (Tables B.1-11a and -11c of Attachment C), the total HI is 1.6.
  - The non-cancer HQ for manganese via the dermal exposure route (1.2) exceeds 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future resident child scenario of exposure to combined surface/subsurface soil (Tables B.1-12a and -12c of Attachment C), the total HI is 10.8.
  - The non-cancer HQ for manganese via the incidental ingestion route (3.1) and the non-cancer HQ for manganese via the dermal exposure route (7.3) both exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.
- For the future construction worker scenario of exposure to combined surface/subsurface soil (Tables B.1-10a and -10c of Attachment C), the total HI is 1.6.
  - No individual exposure routes have HQs for manganese that exceed 1.0.
  - No individual exposure routes have HQs for arsenic that exceed 1.0.

Estimated Carcinogenic Risks

Estimated carcinogenic risks were calculated for all human receptors potentially exposed to surface soil and combined surface/subsurface soil at DU 3 (Appendix B, Tables B.1-6b and -6c through B.1-12b and -12c of Attachment C). Among all the exposure scenarios evaluated, there are no estimated carcinogenic risks for site workers, construction workers, or future resident adults that exceed the acceptable incremental risk of $1x10^{-5}$; however, for the future resident child, estimated carcinogenic risks exceed the acceptable risk for exposure to both surface soil and combined surface/subsurface soil (Appendix B, Tables B.1-9b, -9c, -12b, and -12c of Attachment C).

- For the future resident child scenario of exposure to surface soil (Appendix B, Tables B.1-9b and -9c of Attachment C), the estimated carcinogenic risk for arsenic is $1.3x10^{-5}$, which exceeds the acceptable incremental risk of $1x10^{-5}$ specified by MDE. The carcinogenic risk through individual exposure pathways did not exceed this incremental risk limit.
- For the resident child scenario of exposure to combined surface/surface soil (Appendix B, Tables B.1-12b and -12c of Attachment C), the estimated carcinogenic risk for arsenic is $1.4x10^{-5}$, which exceeds the acceptable incremental risk specified by MDE. The carcinogenic risk through incidental ingestion exposure pathway ($1.1x10^{-5}$) slightly exceeds this incremental risk limit.

7.1.4.4 Decision Unit 4 (DU 4) - Background

Data for arsenic and manganese in soil samples collected from DU 4 (background) underwent risk characterization (Appendix B, Attachment D) to assist with the interpretation of characterizations performed for the three on-site DUs. While the maximum concentrations of arsenic in surface soil (4.5 mg/kg) and subsurface soil (7.2 mg/kg) exceed the screening level for arsenic (0.68 mg/kg), the maximum concentrations of manganese in surface soil and combined surface/subsurface soil

(both 334 mg/kg) are less than the screening level of 900 mg/kg, based on a non-cancer hazard quotient of 0.5.

Estimated Non-Cancer Hazards

Total potential non-carcinogenic HIs for potential human receptors were calculated for arsenic and manganese for surface and combined surface/subsurface soil at DU 4. Total non-carcinogenic HIs do not exceed the acceptable limit of 1.0 under any of the exposure scenarios (Appendix B, Tables B.1-6a and -6c through -12a and -12c of Attachment D).

Estimated Carcinogenic Risks

Estimated carcinogenic risks for potential human receptors were conducted for arsenic only. There are no estimated carcinogenic risks that exceed the acceptable incremental risk of $1x10^{-5}$ specified by MDE.

7.1.5 Uncertainty Discussion

All HHRAs involve the use of assumptions, judgments, and imperfect data to varying degrees, resulting in uncertainties in the final estimates of risk. These uncertainties are associated with each step of the process (USEPA, 1989). The parameters used in the HHRA are conservative and tend to overestimate potential site-related risks. The inherent and site-specific uncertainties associated with the estimation of human health risks are summarized in the following paragraphs.

7.1.5.1 Data Evaluation and Identification of COPCs

Representative sampling at a site is based on the assumption that a sufficient number of samples have been collected to adequately characterize the site. For this RI, a very large dataset was generated, with ISM soil samples collected at each of two depths from 94 sampling locations, 59 of which were located within DU 1. The sampling grids at DU 2 (18 sampling locations) and DU 3 (10 sampling locations) completely covered these DUs. While it is possible that other contaminants are present at the site, by design, this RI was focused only on arsenic and manganese in soil at depths of 2 ft bgs or less. Samples were collected from the proposed locations and analyzed for the two COPCs according to plan (ERT, 2019), resulting in a robust dataset. A relatively small percentage of the dataset were qualified as a result of the validation (Appendix D.2). Both metals were detected in all samples and, as laboratory detection limits were less than all screening levels, uncertainty with respect to detection is reduced.

The data used for this HHRA were validated in accordance with USEPA procedures and specifications given in the UFP-QAPP (Section 2.1). All data were found to be usable for project decision-making purposes. The generic screening levels used for selection of COPCs were appropriately conservative.

7.1.5.2 Exposure Assumptions

As the site currently is not zoned for residential use, the evaluation of residential use scenarios is a conservative approach. The more likely scenarios for exposure to soil are the direct-contact scenarios for current and future site workers and future construction workers.

The exposure assumptions used in the HHRA are based, in many cases, on USEPA default values, which presumably are collated from the best available data; for example, for time spent at one workplace, body surface area, and gastrointestinal absorption factors. However, the USEPA default exposure assumptions may or may not be applicable to scenarios that could occur at this site. Overall, the selection of conservative exposure assumptions for the RME scenarios results in upper-bound (i.e., high- end) estimates of exposures and risks, while the potentially exposed populations could, in reality, have lower exposures and risks.

7.1.5.3 Toxicity Assessment

All published toxicity values have associated uncertainties, which commonly are addressed by USEPA with the application of uncertainty or modifying factors. For example, the uncertainty associated with RfDs is addressed by the addition of safety factors. However, the level of concern does not increase linearly as the reference dose is approached or exceeded, because the RfDs do not have equal accuracy or precision and are not based on the same severity of effect (USEPA, 1989). RfDs have varying levels of confidence and thus incorporate different uncertainty adjustments and modifying factors (e.g., to account for extrapolation from animals to humans, from lowest observed adverse effect levels [LOAELs] to no observed adverse effect levels [NOAELs], from one exposure duration to another). None of these uncertainties in toxicity values have been discussed in this HHRA.

Similarly, the cancer slope factors have varying levels of confidence, which are outlined for each substance by USEPA in the IRIS on-line database (USEPA, 2020a). However, slope factors are inherently conservative, as they are upper-bound estimates (approximating a 95% confidence limit) of increased cancer risk from a lifetime exposure to an agent.

For manganese, the dermal RfD was derived from the oral RfD using a gastrointestinal absorption factor of 0.04. This low value for dermal absorption for manganese may have led to the greater contribution of the dermal pathway to overall risk, relative to the ingestion pathway. Also, an uncertainty for the soil dermal absorption factor (ABS) of 1% (the high range of 0.1% to 1%) is used by Region 3, and this may have elevated the dermal route hazard contribution by a factor of ten.

7.1.5.4 Risk Characterization

There are limitations to the risk characterization step; in particular, the summing of risks from COPCs and across exposure pathways. For example, total hazards were combined for arsenic and manganese, although their critical effects are different (i.e., arsenic can affect the cardiovascular system and skin, while manganese can affect the central nervous system). Summing non-cancer HIs for these two metals assumes dose additivity; however, risks are not necessarily additive. The potential for interactions between the two metals, between or among multiple pathways, and other combinations was not evaluated quantitatively.

7.1.6 **HHRA Conclusions**

Potential exposures and risks to human health have been estimated for arsenic and manganese in surface soil (0-1 ft bgs) and combined surface/subsurface soil (0-2 ft bgs) at each of the three DUs, using conservative exposure scenarios. Based on the HHRA results, cancer risk estimates are less than the MDE limit ($1x10^{-5}$) for current or future site workers and future construction workers exposed to surface or subsurface soil; however, the non-cancer risk estimates to these two receptors from exposure to surface soil and combined surface/subsurface soil exceed the HI limit (1.0) within DU3 (Table 7-1).

Although the Depot currently is not zoned for residential use, this HHRA includes risk characterizations for exposure of future residents (adult and child) to surface and subsurface soil in anticipation of the FS. For the future residential child scenario, exposure to surface or combined surface/subsurface soil at all three DUs results in non-cancer hazard quotients and/or increase in cancer risk that exceed the accepted limits (Table 7-1). For the future residential adult scenario, surface/subsurface soil exposure results in non-cancer hazard levels at DU 3 and cancer risk above the acceptable values at DU 2 (Table 7-1).

Table 7-1. Summary of Non-Carcinogenic and Carcinogenic Risks at DU 1, DU 2, and DU 3

Receptor	Timeframe		Risk	DU 1		DU 2		DU 3	
	Current	Future		Surface Soil	Combined Surface/ Subsurface Soil	Surface Soil	Combined Surface/ Subsurface Soil	Surface Soil	Combined Surface/ Subsurface Soil
Site Worker	X	X	n	0.3	--	0.2	--	**1.4**	--
			c	$3.3x10^{-6}$		$9.8x10^{-6}$		$4.3x10^{-6}$

n non-carcinogenic

c carcinogenic

-- not evaluated

Exceeds hazard index (HI) of 1.0 or carcinogenic incremental risk increase of 1 x 10^{-5} specified by the MDE.

7.2 Screening-Level Ecological Risk Assessment

The purpose of an ecological risk assessment (ERA) is to 1) determine whether unacceptable risks are posed to ecological receptors from chemical stressors, 2) derive chemical concentrations that would not pose unacceptable risks, and 3) provide the information necessary to make a risk

management decision concerning the practical need and extent of remedial action (USEPA, 1997). The ERA process includes the following eight general steps:

1. Screening Level Problem Formulation and Effects Evaluation,
2. Screening Level Exposure Estimate and Risk Calculation,
3. Baseline Problem Formulation,
4. Study Design and DQO Process,
5. Verification of Field Sampling Design,
6. Site Investigation and Data Analysis,
7. Risk Characterization, and
8. Risk Management,

The Depot is located within Region 3 of the USEPA. The primary guidance documents for conducting an ERA for soil-based chemicals for sites located in Region 3 are

- USEPA Ecological Risk Assessment Guidance for Superfund (ERAGS): Process for Designing and Conducting Ecological Risk Assessments (Interim Final), EPA 540-R-97-006, June 1997;
- USEPA Guidelines for Ecological Risk Assessment (Final), EPA 630-R-95-002F, April 1998;
- USEPA Guidance for Developing Ecological Soil Screening Levels, OSWER Directive 9285.7-55, November 2003, Revised February 2005; and
- other USEPA Region 3 guidance documents as listed within the Region 3 website.

The overall objective of a SLERA is to evaluate whether unacceptable adverse risks are or may be posed to ecological receptors as a result of hazardous substance releases. This objective is met by characterizing the ecological plant and animal communities on and near the site, defining the particular contaminants affecting the environmental media at each DU at the site, identifying pathways for receptor exposure, estimating the potential for adverse risk to ecological receptors, and determining the extent to which response actions (including appropriate remedial alternatives) may be warranted.

This SLERA represents the first two steps in the eight-step ERA process. The intent of the SLERA is to provide information to the risk assessment team and risk managers so they may quickly determine if a site poses unacceptable ecological risk, and to identify contaminants and exposure pathways, if any, that may require further evaluation (USEPA, 1997). In Step 1 of the SLERA, important environmental aspects of the site are identified and described. In Step 2, a conservative risk estimate is made, with recommendations for further evaluation for sites identified as having risk that exceeds acceptable levels. The SLERA also identifies data gaps and addresses uncertainties associated with the assessment, conclusions, and recommendations.

Within Region 3, the SLERA process usually proceeds up to and including calculating a hazard quotient (HQ) for each chemical under evaluation. The HQ is either the maximum concentration detected or the 95% upper confidence limit of the mean concentration (95% UCL), divided by the

appropriate ecological screening value (ESV) for that chemical; in this SLERA, both have been evaluated. Any chemical in a DU for which the maximum concentration or 95% UCL concentration results in a HQ exceeding 1.0 is deemed a chemical of potential ecological concern (COPEC) and is examined further.

Upon completion of the SLERA, a scientific management decision point (SMDP) is reached, with three possible outcomes:

- There is adequate information to conclude that ecological risks are within acceptable limits and, therefore, there is no need for remediation on the basis of ecological risks;
- The SLERA is not sufficient to allow a decision, and the risk assessment process should continue to a full, eight-step (Baseline) ERA; or
- The information indicates a potential for adverse ecological effects, and further assessment and/or remedial actions are warranted.

Preliminary uptake modeling for a few likely receptor species may be conducted as part of the SLERA and is commonly referred to as Step 3A. Uptake modeling has been included in this report (Section 7.2.4) using the white-footed mouse and mourning dove, two animal receptors known to inhabit the site and known to be sensitive to the chemicals evaluated.

This SLERA is based on soil data collected in March and April 2019 and relies on information from multiple sampling events over an approximate 20-year period. It draws extensively on the 2005 ecological site assessment and language provided in the assessment report (Parsons 2006). The results of Steps 1 and 2 of this current SLERA process, supplemented by modeling from Step 3A, will be used to identify potential courses of action for the Depot.

7.2.1 Screening Level Problem Formulation and Effects Evaluation (Step 1)

Problem formulation is incorporated at the beginning of the process to determine the focus and scope of the assessment (USEPA, 1997). A CSM is developed, the site's ecological setting is characterized, the assessment endpoints, ecological receptor groups and measurement endpoints are selected, and COPECs and chemical stressors are identified.

7.2.1.1 CSM Development

CSMs are effective tools for describing site dynamics, identifying data gaps, defining hypotheses to be tested in the SLERA, streamlining the risk evaluation, and developing appropriate response actions. Such models are mechanisms for identifying potentially completed exposure pathways between physical media affected by site-related contamination and potential receptors.

The CSM for ecological receptors developed for the Depot was based on the evaluation of receptor exposure pathways associated with all site environmental media known or expected to be affected by site-related chemicals, as determined during previous investigations. Potentially affected media include soils, sediment, surface water, and groundwater via a connection to surface water or sediment and/or biota. Identifying potentially completed exposure pathways is a critical element

of the CSM. Exposure pathways that are potentially complete and for which adequate data are available are quantitatively evaluated in the SLERA.

The ecological CSM developed for each DU identifies exposure to site soils as a complete exposure pathway (current and future) for ecological receptors. Pathways considered in this SLERA include direct exposure (ingestion, dermal, and inhalation) and ingestion of contaminated biota. Various prey, including plants and animals, are consumed by receptors and serve as indirect exposure routes for contaminants. Receptors also incidentally ingest media during foraging activities. While terrestrial receptors are exposed to air, uncertainties associated with inhalation exposures to chemical stressors inhibit assessment of the impacts from exposure to this medium. Similarly, dermal exposure to chemical stressors is difficult to quantify due to a lack of toxicity data. Given these factors, the SLERA for the DUs at the Depot quantitatively assesses exposure to contaminated soil and biota through ingestion.

For most terrestrial receptors, soil exposure intervals are limited to the upper one foot of the soil column, although some burrowing species and deep-rooted plants can be exposed to deeper soils. For this assessment, surface soil was defined as the interval of 0-1 bgs, and combined surface/subsurface soil (mixed surface and subsurface soil) was defined as 0-2 ft bgs. Soils in the potentially impacted areas are only partially covered by pavement and are available for contact by current receptors. In the future, subsurface soils may be uncovered during excavation activities, resulting in contaminants in the subsurface soil becoming available for contact.

Typically, ecological receptors are not directly exposed to contaminants in groundwater, although they may be indirectly exposed via plant uptake or exposed to surface waters into which contaminated groundwater has discharged. Potential migration of contaminants to surface water may occur via groundwater-to-surface water migration and/or sheet flow from soils to surface water. Exposure to groundwater was deemed to be an incomplete pathway at the Depot. Exposure to surface water and sediment at the site were also deemed to be incomplete (ERT, 2016).

7.2.1.2 Ecological Characterization

The Depot and surrounding area were evaluated with respect to operational, physical, chemical, and ecological characteristics, and their current and anticipated future land uses. A site visit was performed on 18 July 2019, to assist with this effort (Appendix B, Attachment G). Understanding current site conditions and land use assists with identifying potential receptors under current and possible future scenarios.

The Depot has been filled, drained, graded, and otherwise altered to the point that there are no undisturbed areas remaining. Currently, the site features consist of warehouses in various stages of disrepair, concrete pads where warehouses once stood, a network of paved and gravel roads, numerous revetments and large piles of spoil, and abandoned railroad tracks and vacated railroad beds.

A large central drainage ditch and numerous shallow ditches convey surface water to adjacent open water bodies, with little surface water retained on-site. The majority of the ditches draining the

site are small, intermittent, and support wetland species like cattail and giant reed. The majority of the area outside the project boundary and within a half-mile radius is urban land and open water.

All areas of the installation have been altered to varying degrees by management practices, whether from mission-related maintenance activities within the last 90 years or from historical farming practices. No natural areas are present within the boundaries, and no trees are present that are more than 60 years old. In 2005, a detailed on-site field effort was conducted as part of a Focused RI (Parsons, 2006), with a one-day confirmatory site visit conducted on 18 July 2019, supplementing this earlier effort (Appendix B, Attachment G) and Table7-2). Major habitat types identified during the 2005 and 2019 site visits are summarized as follows.

Successional Old Field. The majority of the Depot falls into this vegetation classification. This habitat type occurs in areas in which the vegetation and/or soil have been altered by clear-cutting, grading, draining, mowing, or other activities commonly associated with land management practices. The vegetative cover in these areas is limited to herbaceous species and early successional tree and shrub species common to recently or routinely disturbed areas and includes numerous nuisance exotic and opportunistic species. It appears that the site has been planted with a commercial mixture of grass and forb species commonly used on fallow agricultural lands to enrich the soil, provide forage for wildlife, and prevent erosion. Some areas have been overrun with poison ivy, Virginia creeper, Bradford pear, and other species. Small pockets of shrub species include persimmon, black cherry, and sassafras, as well as other woody species. All upland areas within the Depot that do not support a shrub or tree stratum exceeding 50% cover fall into this classification. This vegetation classification provides excellent habitat for the white-tailed deer, which were often observed foraging in the old field areas. Other species observed in this habitat include eastern cottontail rabbit, numerous songbirds, and red fox.

Successional Hardwoods. Successional hardwood communities develop in areas that have been cleared, graded, filled, or otherwise disturbed. The canopy, which may form within seven years of disturbance, usually is composed of fast-growing species that require a significant amount of light. When the canopy in this community becomes fairly dense, the canopy species usually do not reproduce because of the reduced sunlight, and shade-tolerant trees and understory and ground cover species become established. This vegetation community is characterized by the dominance of early- and mid-successional native and introduced tree species. Common canopy species include black locust, tree of heaven, Bradford pear, tulip tree, silver maple, and eastern cottonwood. Understory species, when present, include shade-tolerant species such as ferns and vines. The wildlife found in this habitat includes white-tailed deer, raccoon, opossum, northern flicker, northern cardinal, and numerous other songbirds.

Artificial Pond. A very small (0.72 acre) pond is located [redacted] on the east side of the site. The pond is man-made, and the vegetation is dominated by giant reed and cattail. The pond appears to internally drain. This pond offers marginal wildlife habitat due to the lack of beneficial vegetation and the poor, stagnant water quality.

Ditch/Channelized Stream. Several channelized streams and excavated drainage ditches are found throughout the study area. The largest ditch drains the western portion of the site and discharges into Back Creek on the southwestern boundary. Other small collection ditches also drain to Back Creek. The northeastern portion of the site drains to the east to discharge into Curtis Creek. The large ditch/creek had standing water present and supports some native vegetation. The smaller ditches were vegetated predominantly with giant reed, although some cattail, soft rush, and other herbaceous species were present in some areas. Many of the ditches support common upland ruderal species and likely function only as conveyance systems during severe storms. In the eastern portion of the site, just west of the culvert under Yard Office Road, a shallow wetland has formed in a depression. The wetland supports giant reed, soft rush, cattail, blue-eyed grass, and ferns. This wetland is man-made and too small to provide significant wildlife habitat.

Table 7-2. Species Observed at the Depot in 2006 and 2019

X indicates field survey in 2005.
Y indicates field survey in 2019.

Residential, industrial, and other types of the built environment are described jointly as urban lands. The features included in this category are roadways, buildings, residential areas, industrial areas, agricultural areas, railroad tracks, and other areas of anthropogenic origin that provide very little ecological value. For example, the Depot has a network of paved and gravel roads, although some have not been used recently and are overgrown. The roads do not offer forage opportunities for most species but do provide basking areas for certain ectothermic species during cooler weather, thereby offering prey opportunities for certain predators. Deer and other mammals use the roads as game trails. Additionally, the abandoned buildings within the Depot provide nesting habitat for barn swallows, roosting sites for bats, and shelter for small mammals. No other habitat utilization of the abandoned buildings was observed. Although no bats or bat droppings were observed in the vicinity, it is very likely that bats inhabit the Depot, and the abandoned buildings provide excellent habitat. Railroad tracks within the site observed in both 2005 and 2019 are abandoned. The abandoned tracks are largely overgrown and provide some habitat.

Wildlife resources at the depot are not managed. Commonly occurring small mammals include eastern cottontail rabbit (Sylvilagus floridanus), raccoon (Procyon lotor), and red fox (Vulpes vulpes). Waterfowl may be attracted to the open water areas around the Depot, but the wetlands on site would not provide appropriate habitat for these species. The wildlife within a half-mile of the site consists of upland species, particularly those accustomed to urban existence, and aquatic species accustomed to survival in a high-use, highly disturbed open waterbody. Wildlife evidence and direct observations were made during site visits in 2005 and 2019 (Table 7-2).

Following the field survey conducted in 2005, an inquiry to the Maryland Department of Natural Resources Wildlife and Heritage Division (MDNRWH) resulted in the Division reporting no known rare, endangered, or threatened species or rare habitats on Depot property; i.e., there were no records of any state- or federally-protected species or rare habitats on the Depot in any of the MDNRWH databases (U.S. Department of Agriculture 1998). In June 2019, MDNRWH promulgated its newest list of rare, threatened, and endangered (RTE) species for Anne Arundel County (MDNR, 2019). This list includes both animals and plants.

A least tern colony was observed nesting on the roof of the Central Atlantic Toyota building within one-quarter mile of the Depot site during the 2005 site assessment. The least tern is a threatened species within the state of Maryland and is known to nest on barren areas with a sand or gravel substrate. There is no suitable habitat for this species on the Depot property.

The most recent mapping for bald eagle nests (Maryland Bird Conservation Partnership n.d.) indicates no eagle nests on site; however, bald eagles and peregrine falcons are known to nest within two miles of the site. The bald eagle is listed as threatened by both the U.S. Fish and Wildlife Service (USFWS) and the MDNRWH. The bald eagle may use the waters adjacent to the site for foraging, but there are no trees on site that would be suitable for nesting.

The peregrine falcon is listed by the state of Maryland as "In Need of Conservation", which is a protection status. As with the bald eagle, the peregrine falcon may forage on or around the Depot, but there is no suitable nesting habitat.

At least three osprey nests are present at the site, all on power poles near the Army/Marine Facility on Curtis Creek. The osprey is no longer protected by the federal Endangered Species Act or considered at risk in the state of Maryland, but it is protected by the U.S. Migratory Birds Treaty, which makes it illegal to disturb the birds or nests.

Field investigation of the site determined that the surrounding area is highly modified and has a disturbed ecology resulting from management consistent with mission activities. Highly-disturbed sites characteristically are colonized by opportunistic species and typically do not support rare or endangered flora and fauna. No rare or endangered species were observed during either the 2005 or 2019 site assessments.

The habitat value of the Depot site itself is considered poor, due to the lack of native vegetation, the highly urbanized nature of the surrounding lands, and the human activity on-site. The site offers habitat for only the common species of flora and fauna that have adapted to disturbed habitats.

7.2.1.3 Selection of Assessment Endpoints

Ecological risks should be expressed in terms of a definite endpoint, which is defined as an environmental value to be protected. Assessment endpoints are "explicit expressions of the actual environmental value that is to be protected" (USEPA, 1998). The assessment endpoints provide a transition between broad management, or policy goals, and the specific measures used in the assessment, supported by numerically-defined decision rules (**Table 7-3**). Under this approach, the proposed assessment endpoints are the survival and reproduction of terrestrial biotic populations that may be affected by previous Depot operations. The assessment endpoints are addressed through the comparison of maximum and 95% UCL concentrations with recently-promulgated USEPA Region 3 Soil Screening Levels (SSLs) for terrestrial plants, soil invertebrates, mammals and birds. Maximum detected concentrations and 95% UCLs for arsenic and manganese in surface soil and combined surface/subsurface soil are provided for each of the three DUs in Appendix B, Attachments A, B, and C.

7.2.1.4 Selection of Receptor Group(s)

Ecological SSLs for arsenic and manganese have recently been developed by USEPA Region 3 (USEPA, 2005) (USEPA, 2007). These screening levels include concentrations related to the following receptor groups: plants, soil invertebrates (manganese only), mammals, and birds.

Ecological receptors at the Depot include terrestrial plants and wildlife that reasonably may be expected to reside or regularly forage in areas affected by site contaminants (i.e., arsenic and manganese), given current and anticipated future site conditions.

Vegetative communities throughout most of the site consist of successional old field and successional hardwoods (Section 7.2.1.2). While no special-concern plant species or sensitive plant communities have been observed at the Depot, plants have been evaluated as a receptor group. Soil invertebrates, mammals, and birds also are considered as receptors. For the two chemical species of COPECs evaluated for this SLERA, the lowest SSLs are related to the plant receptor group.

If the comparison of chemical concentrations with SSLs results in HQs greater than one (1.0), it may be necessary to proceed from the SLERA to a full Baseline ERA (Steps 3 through 8). Specific species of plants and animals likely would need to be identified and selected for uptake modeling beyond the limited modeling performed for two representative species (i.e., the white-footed mouse and mourning dove) (Section 7.2.4). For this SLERA, the decision to proceed beyond Step 3A will be based on the results of comparing maximum concentrations or maximum 95% UCL concentrations for arsenic and manganese with Region 3 SSLs for the most sensitive receptor group(s). Alternatively, limited remedial action may reduce the ecological risks to acceptable levels and preclude the need for a Baseline ERA.

7.2.1.5 Selection of Measurement Endpoints

A measure of effect (i.e., measurement endpoint) is a measurable ecological characteristic that is related to the valued characteristic chosen as the assessment endpoint. Effects relative to the assessment endpoint are extrapolated from the selected measurement endpoints (Table 7-4). For both arsenic and manganese, the plant receptor group is the most sensitive species group, with SSLs of 18 mg/kg and 220 mg/kg, respectively.

7.2.1.6 Identification of Chemical Stressors

Arsenic and manganese detected in the soils at the Depot (Tables D.3-1 through D.3-8 of Appendix D.3) were identified as COPECs and carried through the SLERA process. The maximum detected concentrations and the maximum 95% UCL concentrations (i.e., calculated for either surface soil or combined surface/subsurface soil), were compared with the selected SSLs developed by USEPA Region 3 and confirmed as chemical stressors (Table 7-4). Area-weighted mean concentrations also were evaluated.

Table 7-3. Policy Goals, Ecological Assessment and Measurement Endpoints, and Decision Rules

Policy Goals	Assessment Endpoint	Measurement Endpoint	Decision Rule
Policy Goal 1: The conservation of threatened and endangered species (TES) and their critical habitats.	**Assessment Endpoint 1**: No reduction in numbers of individuals of any state- or federally-designated TES.	**Measurement Endpoint 1:** Identification of potential TES habitat; COPEC concentration in physical media and predicted exposure point concentration for TES receptors.	**Decision Rule for Assessment Endpoint 1:** If TES habitat is not present, or COPEC EPCs in the media do not exceed toxicity screening thresholds or dietary NOAELS (i.e., HQ<1), the assessment endpoint is met, and TES are not at risk.
Policy Goal 2: The protection of terrestrial and aquatic species in undeveloped areas capable of sustaining wildlife populations in the vicinity of the Depot.	**Assessment Endpoint 2**: Survival and reproduction of terrestrial and aquatic populations in the area of the Depot.	**Measurement Endpoint 2**: No-effect and lowest-effect chronic non-lethal concentrations of COPECs on survival and reproduction of identified receptors.	**Decision Rule for Assessment Endpoint 2**: If ratios of estimated exposure concentrations predicted from COPEC EPCs in soil, sediment, and surface water to NOAEL toxicity reference values for adverse effects on identified receptors (HQs) are <1, then Assessment Endpoint 2 is met and terrestrial and aquatic species are not at risk. If ratios are > 1, the COPEC is retained as a preliminary COC for further evaluation in the uncertainty section. Final COCs are recommended based on an evaluation of the available weight of evidence.

COPEC Constituent of potential ecological concern
COC Chemical of concern
EPC Exposure point concentration
HQ Hazard quotient
NOAEL No observed adverse effect level
TES Threatened and endangered species

7.2.2 Exposure Estimates and Risk Calculation (Step 2)

Exposure estimates are obtained by identifying and quantifying potential pathways of biota exposure to the identified COPECs. The exposure assessment is conducted by characterizing the magnitude (concentration) and distribution (locations) of the contaminants of interest detected in the impacted media, evaluating pathways by which the contaminants may be transported through the environment, and determining the points at which organisms identified at the site may contact contaminants.

Ecological exposure pathways for biota may be direct or indirect. Direct exposure pathways include dermal contact, absorption, inhalation, and ingestion. Examples of indirect exposure include animals incidentally ingesting contaminated soil; plants or invertebrates absorbing contaminants by uptake from contaminated soil; and dermal contact of animals with contaminated soil.

Food web (indirect) exposure pathways for biota can occur when terrestrial fauna consumes previously contaminated biota. Examples of food web exposure include animals at higher trophic levels consuming plants or animals that bioaccumulate contaminants. Contamination of biota could result from exposure to one or more COPECs.

Bioavailability is an important contaminant characteristic that influences the degree of chemical-receptor interaction. Bioavailable compounds are those that a receptor can take in from the environment. Bioavailability is a function of several physical and chemical environmental factors. These properties directly affect a contaminant's behavior in regard to receptor exposure.

Exposure pathways consist of four components: source and mechanism of contaminant release, transport medium, potential receptors, and exposure route. If any of these components are not complete, then contaminants in those media do not constitute an environmental risk at the site.

The concepts of bioaccumulation and biomagnification historically have been applied in several ways, typically in reference to aquatic organisms. These terms also are used for terrestrial organisms in this report. Bioaccumulation refers to the uptake and retention of a substance by an organism from its surrounding medium and food, and biomagnification refers to the process by which tissue concentrations of bioaccumulated toxic substances increase as the substances pass up through two or more trophic levels (Suter, 1993).

Potentially completed pathways are identified for the Depot in the CSM (Section 3.1.1). Ecological receptor exposure pathways potentially associated with affected media are described in the following paragraphs.

7.2.2.1 Soil Exposure Pathways

Potential receptors of soil contaminants include terrestrial flora and fauna. Most exposure of plants and animals is to the upper few feet of the soil column, typically corresponding with the plant root zone (USEPA, 1992) (Burt and Grossenheider, 1980). The primary potential ecological receptor exposure interval for which characterization data were collected is shallow soils (0-1 ft bgs). This

interval was considered appropriate for evaluating soil contaminant exposures to surface-foraging and shallow-burrowing wildlife and to many forage plants (e.g., grasses and forbs). To assess both potential future and burrowing and/or deep-rooted plant site conditions, the deeper soil interval (0-2 ft bgs) also was evaluated.

7.2.2.2 Biota Exposure Pathways

Plants may be exposed directly to site-related soil contaminants via uptake through the root system. Animals may be exposed directly and indirectly to site-related contaminants through incidental ingestion of soil and ingestion of biota (plants and animals) that have bioaccumulated contaminants.

7.2.2.3 Exposure Assessment

For the SLERA, exposure assessment is limited to a comparison of either the maximum concentration of chemical in the soil or the 95% UCL concentration with the USEPA Region 3 SSLs; HQs based on area-weighted mean concentrations also were calculated as a point of reference (Table 7-5). Any chemical concentration that exceeds the SSL may be carried forward to a Baseline ERA wherein specific receptor species are selected along with exposure rates, which involves the calculation of feeding and watering rates for site receptors. Various technical documents (USEPA, 1997 and 1999) include exposure information for avian and mammalian species. Data are directly available for body weights of various species. Similarly, information regarding feeding rates, watering rates, and dietary composition, including incidental soil ingestion, also are available for many species. Calculating wildlife receptor exposure rates involves the use of uptake models. These would be employed should the decision be made to proceed to a Baseline ERA beyond the limited uptake modeling performed as Step 3A of this SLERA.

7.2.2.4 Risk Characterization

Risk characterization involves both risk estimation and risk description. With risk estimation, the exposure and stressor-response profiles are integrated, resulting in an estimate of the probability to which adverse effects to assessment endpoints will result (USEPA, 1998). Risk description involves a complete summary of conclusions of the risk estimates and addresses the uncertainty, assumptions, and limitations of the risk estimate. Risk characterization represents the final stage of the SLERA. All elements were summarized and used in an iterative manner to define the nature of the ecological risks associated with the Depot.

Risk Estimation

Risk estimation is determined by calculating HQs that equal the estimated exposure divided by the toxicity of each COPEC to site receptor group(s). HQs are used to evaluate the potential for unacceptable adverse effects on terrestrial biota within the Depot property. If the risk estimation process indicates the potential for adverse effects to occur, further evaluation may be warranted. If the HQ assessment demonstrates that adverse effects are not likely to occur, the SLERA is considered complete and no further assessment is warranted. The HQs calculated for arsenic and

manganese in soil at DU 1, DU 2, and DU 3, based on the USEPA Region 3 SSLs, indicate that both potentially pose unacceptable ecological risks (Table 7-5), summarized as follows.

- For DU 1:
  - The maximum concentration of arsenic detected in surface soil (55.1 mg/kg) and the 95% UCL of the mean for arsenic in surface soil (18.6 mg/kg) both exceed the ecological SSL concentrations for plants, birds, and mammals (Table 7-4). The maximum concentration of arsenic detected in combined surface/subsurface soil (55.1 mg/kg) is the same as for surface soil, but the 95% UCL for combined surface/subsurface soil (14.9 mg/kg) is slightly lower and does not exceed the SSLs for any of the three ecological receptors.
  - The maximum concentration of manganese detected in surface soil (27,700 mg/kg) and the 95% UCL of the mean for manganese in surface soil (6,153 mg/kg) exceed the ecological SSL concentrations for manganese for all four ecological receptors (plants, soil invertebrates, birds, and mammals). The maximum concentration detected in combined surface/subsurface soil (27,700 mg/kg) is the same as for surface soil, but the 95% UCL for combined surface/subsurface soil (3,780 mg/kg) is lower and exceeds the SSLs only for plants and soil invertebrates.
- For DU 2:
  - The maximum concentration of arsenic detected in surface soil (118.8 mg/kg) and the 95% UCL of the mean (55.6 mg/kg) exceed the ecological SSLs for plants, birds, and mammals. The maximum concentration of arsenic in combined surface/subsurface soil (137.1 mg/kg) and 95% UCL of the mean (52.4 mg/kg) also exceed the ecological SSL concentrations for plants, birds, and mammals (Table B.2-3).
  - The maximum concentration of manganese detected in surface soil (7,010 mg/kg) is the same as for combined surface/subsurface soil and exceeds the ecological SSLs for all four receptor species (plants, soil invertebrates, birds, and mammals). The 95% UCL of the mean for surface soil (2,764 mg/kg) and combined surface/subsurface soil (1,675 mg/kg) exceed the ecological SSL concentrations for manganese for plants and soil invertebrates but not for birds or mammals.
- For DU 3:
  - The maximum concentration of arsenic detected in surface soil (24.4 mg/kg) and the 95% UCL of the mean (24.4 mg/kg) exceed the ecological SSLs only for plants. The maximum concentration of arsenic detected in combined surface/subsurface soil (108.1 mg/kg) exceeds the ecological SSLs for all three receptor species, while the 95% UCL exceeds the SSL only for plants.
  - The maximum concentration of manganese detected in surface soil (48,800 mg/kg) is the same as that detected in combined surface/subsurface soil and exceeds the SSLs for all four receptor species. The 95% UCLs for surface soil (29,584 mg/kg)

and combined surface/subsurface soil (22,945 mg/kg) also exceed the SSLs for the four receptor species.

Risk Description (including Uncertainty Analysis)

Risk description involves preparing a summary of conclusions of the risk estimates and addresses the uncertainty, assumptions, and limitations of the risk estimate. Uncertainty analysis is an important component of the SLERA.

A qualitative analysis was made of the uncertainties associated with the SLERA. This analysis allows the potential magnitude of underestimating or overestimating the potential for adverse effects to organisms to be identified. Lines of evidence and associated uncertainties that were evaluated include:

- relevance of evidence to the assessment endpoints;
- relevance of evidence to the CSM;
- sufficiency and quality of literature toxicity data and experimental designs;
- potential for bioaccumulation of contaminants;
- site risk relative to background risk;
- spatial pattern of contamination over the site (e.g., site-associated chemicals vs. those associated with stormwater runoff, etc.);
- size of site relative to foraging area of receptors;
- quality of habitat for receptors;
- strength of cause/effect relationships; and
- relative uncertainties of weight of evidence.

The uncertainty analysis and results of the SLERA are evaluated to determine the potential for adverse effects to affect the assessment endpoint. USEPA lists five criteria for evaluating adverse changes in assessment endpoints (USEPA, 1998), including:

- nature of effects,
- intensity of effects,
- spatial scale,
- temporal scale, and
- potential for recovery.

Uncertainty Associated with Preliminary Problem Formulation

The preliminary problem formulation step of the SLERA may have some degree of uncertainty regarding the selection of COPECs, identification of potential exposure pathways, and the selection of receptor species. The selection of assessment and measurement endpoints is determined by USEPA guidance (USEPA, 1995b, 1995c, 1997, and 1998).

The screening criteria used for the selection of ecological COPECs were taken directly from USEPA Region 3 SSLs. These SSLs are, by design, conservative, to minimize the possibility of eliminating a potentially harmful chemical. On a species-specific level, with realistic area use and

uptake factors that would be presented in a Baseline ERA, some COPECs may be eliminated from further consideration.

The selection of exposure pathways is a direct result of the sample data. To determine the potential exposure to ecological receptors to site-related constituents, the presence of constituents in environmental media must first be established. The magnitude at which these constituents are present also greatly influences resulting exposure estimates. The sampling data may not represent the actual overall distribution of contamination in the media at the site, which could result in underestimation or overestimation of potential risk from identified chemicals. However, the calculation and use of the EPC provides conservative exposure estimates and, therefore, it is unlikely that risk have been underestimated.

Receptor groups were compared with the same receptor group SSLs from USEPA Region 3. If the evaluation proceeds to a Baseline ERA, receptor group(s) will be replaced by specific analysis of individual species receptors, beyond the limited modeling performed as Step 3A (Section 7.2.4). These receptors will be selected based on several factors, including their known or potential occurrence in the vicinity of the Depot, as well as their level of sensitivity to contaminants. These decisions are based on best professional judgment and recommendations by USEPA guidance documents regarding wildlife exposure parameters and calculations (USEPA, 1998).

Uncertainty Associated with Ecological Effects Evaluation

Toxicity studies for species other than the receptor species of concern often are used in the development of toxicity reference values (TRVs). The use of related species to estimate toxicity to a representative receptor species may overestimate or underestimate risk due to different species sensitivity to particular toxicants.

Uncertainty Associated with Preliminary Exposure Assessment

Factors that can contribute to uncertainty in the exposure assessment include identification and evaluation of exposure pathways, assumptions for scenario development, intake parameters, and the use of the conservative EPCs. Exposure and toxicity information generally are not available for dermal or inhalation exposure; hence, the lack of quantitative evaluation may underestimate risk. On-site exposure of receptors to COPECs may occur via dermal and inhalation pathways. Although intake of contaminants from these additional pathways may occur, these exposure routes are expected to be negligible compared to exposure via ingestion routes. Therefore, the impact to the overall contaminant exposure is expected to be minor.

Another source of exposure estimation uncertainty is that contamination is assumed to remain constant over time. Fate-and-transport mechanisms, which would result in the degradation and loss of some COPECs from the environment, may not be considered in the exposure evaluation for ecological receptors. Metals in solid matrices frequently are bound to particles or form complexes with other elements, which would tend to reduce the bioavailability of the metals to receptors. Extensive scientific data support the concepts that the longer the chemicals remain in soil, (1) the less readily they are removed by solvents, including water, (2) the less available they

become to microorganisms, (3) the less toxic they become to organisms such as earthworms, and (4) the less they are ingested by organisms such as earthworms. This reduction in availability of the chemicals reduces the risk associated with their presence in the soil (Stroo, et al., 2005).

Estimations of uptake and retention of COPECs using bioaccumulation factors (BAFs) often do not account for the depuration of COPECs from the organism's system over time. Also, BAFs are reflective of the most contaminated source of the organism's diet fraction. For example, a receptor's invertebrate diet may consist largely of insects, while, for most COPECs, the invertebrate BAF used was reflective of earthworm bioaccumulation, as the earthworm BAFs generally are more conservative than other invertebrate BAFs.

Uncertainty Associated with Preliminary Risk Characterization

The preliminary risk characterization step may have some degree of uncertainty regarding risk estimation and risk description. Uncertainties in the risk estimation are compounded under the assumption of dose additivity or non-additivity for multiple substance exposure. For this assessment, it was assumed that the potential toxic effects of the COPECs (i.e., arsenic and manganese) were non-additive. This assumption may result in the underestimation of risk as concurrent exposure to several contaminants could have synergistic toxic effects. The risk characterization of metals does not include additive effects as there is no evidence of clearly additive effects in ecological systems.

Table 7-4. Hazard Quotients (HQs) based on USEPA Region 3 Ecological Soil Screening Levels

COPEC	Location	Soil Interval	Area-Weighted Mean	Maximum Detected Value	95% UCL	Species	ECO-SSL[1]	HQ using Area-Weighted Mean	HQ using Maximum Detected Value	HQ using 95% UCL

All results used for calculating HQs are in milligrams per kilogram (mg/kg).
HQs exceeding 1.0 are **bolded** and highlighted.

1. Ecologic Soil Screening Levels (ECO-SSLs) are from either:
   Region 3 Ecologic Soil Screening Levels for Arsenic Interim Final OSWER Directive 9285.7-62, or
   Region 3 Ecologic Soil Screening Levels for Manganese Interim Final OSWER Directive 9285.7-71.

This Page Intentionally Left Blank

7.2.3 Identification of COCs

The higher maximum detected concentration and higher 95% UCL concentration obtained for each metal at each of the three DUs were compared with USEPA Region 3 ecological SSLs for arsenic and manganese and used to calculate HQs for identifying ecological contaminants of concern (COCs) (Table 7-4 and Table 7-5). USEPA guidance qualitatively describes HQ ranges as

- 1-10 relatively low risk
- 10-100 moderate risk
- > 100 high risk

7.2.3.1 Arsenic HQs

None of the HQs for arsenic at any of the three DUs equal or exceed 10, indicating that exposure to arsenic in surface or combined surface/subsurface soil poses only low risk to ecological receptors (Table 7-4).

DU 1

The 95% UCL of the mean for arsenic in surface soil at DU 1 (18.6 mg/kg) slightly exceeds the Region 3 SSL concentrations for plants but yields an HQ of 1.0 after rounding (Table 7-5). The 95% UCL does not exceed the Region 3 SSL for birds or mammals. Based on this evaluation, arsenic in soils at DU 1 does not pose an unacceptable ecological risk.

DU 2

The 95% UCL of the mean for arsenic in surface soil at DU 2 (55.6 mg/kg) exceeds the Region 3 SSL concentrations for plants, birds, and mammals (Table 7-5). Given that these SSLs are based on highly conservative assumptions, and given the highly disturbed nature of the site, the HQ for plants of only 3.1 likely does not represent an unacceptable risk to the populations of any plant species on-site. For these reasons, it is concluded that arsenic in soils at DU 2 is not likely to pose an unacceptable ecological risk.

DU 3

The 95% UCL of the mean for arsenic in combined surface/subsurface soil at DU 3 (25.7 mg/kg) exceeds the SSL concentration for plants (18 mg/kg) by a relatively small amount (Table 7-5). It does not exceed the USEPA Region 3 SSL for birds or mammals. As noted previously, the SSLs are based on highly conservative assumptions, and the fact that the HQ for plants only slightly exceeds 1.0 and HQs for all other receptors do not exceed 1.0 suggests that arsenic in soil at DU 3 does not pose an unacceptable ecological risk.

Table 7-5. Summary of Hazard Quotients (HQs) for Arsenic

COPEC	Location	Maximum Detected Concentration		95% UCL		Species	SSL	HQ using Maximum Concentration	HQ using 95% UCL
Arsenic	DU 1	55.1	(surface soil)	18.6	(surface soil)	Plants	18	**3.1**	1.0
						Soil Invertebrates	NA	--	--
						Birds	43	**1.3**	0.43
						Mammals	46	**1.2**	0.40

7.2.3.2 Manganese HQs

Manganese is an essential nutrient for plants and animals. Manganese is ubiquitous in the environment, and exposure arises from both natural and anthropogenic activities. It occurs naturally in more than 100 minerals. Different sources provide a variety of ranges of concentrations for manganese in soils, with one citing manganese concentrations in soils of the United States as ranging from 2 to 7,000 parts per million (ppm), with an arithmetic mean of 550 ppm (Shacklette and Boerngen, 1984). Other studies have shown that background levels of manganese in soil range from 40 to 900 mg/kg, with an estimated mean background concentration of 330 mg/kg (Barceloux 1999). Naturally-occurring concentrations of manganese in soil of up to 3,000 mg/kg have been reported for Wisconsin, with evidence that much of this may not be bio-available (Schulte and Kelling, 1999).

The bioavailability of manganese in soils depends on many factors, including oxidation state, pH, degree of organic matter, aerobic vs. anaerobic conditions, oxidation-reduction potential, soil moisture content, present of cations, etc.). Manganese in soils commonly occurs as manganese oxides, carbonates, silicates, and sulfides and is found in multiple valence states in soils. Manganese +2 is the form that is most readily available for plant use. Forms of manganese in soils can change rapidly based upon factors such soil moisture content as affected by rainfall. Manganese deficiency in soils can be a serious issue for agriculturalists, and great care is taken by farmers to ensure that adequate concentrations of manganese are bioavailable for crops.

Because the availability of manganese in soils can change, it can be difficult to assign a threshold soil concentration that is harmful to plants. During the 18 July 2019, ecological site visit (Appendix B, Attachment G), care was taken to visually examine vegetation for the following signs of manganese toxicity: brown spots, leaf yellowing, pale green color between veins, sunken patches between veins, and necrotic spots. Overall, vegetation within DU 1 and DU 2 appeared normal, with no visual signs of manganese toxicity. Likewise, no obvious signs of leaf [redacted] were observed within DU 3; however, woody vegetation within DU 3 appeared somewhat stunted in comparison with surrounding areas. Whether this was due to excess manganese within the plants could not be determined visually. Because of the variability of manganese forms in soils, the variability of manganese availability to biota, and the needs of the biota for manganese, preliminary HQs calculated for manganese toxicity in soils (Table 7-6) should be examined with some degree of leniency.

DU 1

The 95% UCL of the mean for manganese in surface soil at DU 1 (6,153 mg/kg) exceeds the SSL concentrations for manganese for plants, soil invertebrates, birds, and mammals (Table 7-6). However, the HQs for birds and mammals are only slightly greater than 1.0, and HQs for birds and mammals based on the maximum detected concentration are well below 10, indicating a low level of ecological risk for these two ecological receptors.

DU 2

The 95% UCL of the mean for manganese in surface soil at DU 2 (2,764 mg/kg) exceeds the SSL concentrations for manganese for plants and soil invertebrates but not for birds or mammals (Table 7-6). The HQs for birds and mammals, based on the maximum concentrations, are only somewhat greater than one. As noted previously, these SSLs are based on highly conservative assumptions, and the resulting HQs may overstate the potential ecological threats due to manganese at DU 2.

DU 3

The 95% UCL of the mean for manganese in surface soil at DU 3 (29,584 mg/kg) exceeds the SSL concentrations for manganese for plants, soil invertebrates, birds, and mammals. Utilizing the mean soil concentration (18,580 mg/kg) still results in HQs of greater than 10 for plants and soil invertebrates (Table 7-6). Given that neither group is capable of significant movement, potentially unacceptable risk is possible.

Table 7-6. Summary of Hazard Quotients for Manganese

COPEC	Location	Maximum Detected Concentration		95% UCL		Species	SSL	HQ using Maximum Concentration	HQ using 95% UCL
Manganese	DU 1	27,700	(surface soil)	6,153	(surface soil)	Plants	220	**126**	**28**

7.2.4 Uptake Modeling (Step 3A)

To provide additional information for the SMDP deliberations that are to follow the SLERA, preliminary uptake modeling was conducted for the site. The modeling took the greatest 95% UCL concentration for any of the DUs (55.6 mg/kg for arsenic and 29,584 mg/kg for manganese), with conservative ingestion parameters from USEPA documents and an area use factor (AUF) of 100% (i.e., under the assumption that the receptor spends all of its time feeding within the area of highest chemical concentration). The modeling was performed with two animal receptor species known to occur on-site and known to be sensitive to the chemicals in question: the white-footed mouse and the mourning dove. These two species often are utilized for modeling of soils as both are ground foragers that will ingest soil along with soil invertebrates (the mouse), plants (both species) and seeds (both species).

Consistent with USEPA ecological risk assessment guidance, arsenic and manganese were evaluated based on published literature and environmental toxicity databases regarding characteristics of environmental transport, fate, and known toxicity among floral and faunal species during the development of conceptual exposure models, including pathway and receptor model species selection. Pathways and receptors were chosen to produce the maximum estimate of exposure and toxic effects, based on the contaminant-specific properties.

For terrestrial receptors, the potential for toxic effects from soil contaminants is driven by the ingestion pathway. The exposure through this pathway relates primarily to contaminants ingested

along with soil and contaminants that have entered a food chain. There are considerable experimental data from feeding studies on contaminants in laboratory rodents, and rodents have been shown to be relatively sensitive to contaminant exposure through this pathway. Based on the relatedness to the test species and its presence at the site, it is assumed that the mouse is a sensitive receptor for ingestion of COPECs from soils found at this site. Mice ingest soil while grooming, and their omnivory exposes them to bioaccumulation through both plant and animal sources. Uptake in soil-dwelling invertebrates (e.g., earthworms) frequently is the manner in which COPECs enter animal food chains, and the mice feed on these organisms. Thus, the white-footed mouse is expected to receive a relatively large exposure to soil contaminants through the pathway most sensitive for terrestrial vertebrates and thereby serves as a suitable, sensitive receptor species.

There are fewer toxicity data in the literature for birds, but, in most cases, data are adequate for assessment purposes. The mourning dove represents the common ground-foraging birds at the site. The mourning dove is an herbivore and incidentally ingests soil while foraging. Furthermore, mourning doves forage in ruderal communities in and adjacent to the site of contamination. Therefore, the mourning dove was selected as a receptor model species for upland birds and is a reasonable surrogate species for other ground-feeding species of birds.

Exposure for the terrestrial mourning dove and cotton mouse to soil contaminants was modeled by a food chain uptake model as follows.

$$TE = [[(Csoil \times Isoil) + (Csoil \times SP \times CF \times Iplant) + (Csoil \times BAF1 \times Iinvertprey)] \times SFF] / BW$$

Where:

TE	=	total (combined soil, plant and animal ingestion) exposure dose (mg/kg/day)
C_{soil}	=	concentration of the COPEC in soil (mg/kg)
I_{soil}	=	soil ingestion rate (kg/day)
SP	=	soil-to-plant uptake factor, assumed to be 1.0 if no data are available
CF	=	dry-to-wet-weight conversion factor, used where needed, and assumed to be 0.2
I_{plant}	=	plant ingestion rate (kg/day)
BAF1	=	maximum bioconcentration factor for invertebrates from the literature for the COPEC
$I_{invertprey}$	=	daily ingestion rate of invertebrate prey items (kg/day)
SFF	=	site-specific foraging factor, set to 1.0 for all calculations by default
BW	=	body weight of average receptor species (kg) from literature

Ingestion rates and body weights differ between receptors and are given in the respective tables. Ingestion rates for the mouse were based on values for the white-footed mouse (USEPA, 1993).

The food uptake model is adapted from USEPA (USEPA, 1999). Because the dove is herbivorous, the ingestion rate of contaminated invertebrates is assumed to be zero in the model. In contrast, the mouse is relatively omnivorous in consuming insects, earthworms, and other invertebrates, as well as plant material (primarily seeds). The equations for estimating the concentration of contaminants in plants and invertebrates are contaminant-specific and given in the EPA ecological SSL documents for arsenic and manganese.

For the dove receptor, the TRVs (NOAEL was used), ingestion rates, and equation for estimating the concentration of the contaminant in plant material consumed were taken from Table 5.2, page 8, for USEPA guidance for arsenic (USEPA, 2005) and Table 5.2, page 10, for USEPA guidance for manganese (USEPA, 2007). The dove food ingestion rate is 0.019 kg/kg body weight per day, and the soil ingestion as proportion of diet is 0.139.

Parameters for the mouse are based on data for the white-footed mouse given in the Wildlife Exposure Factors Handbook (USEPA, 1993) and in Toxicological Benchmarks for Wildlife (U.S. Department of Energy, 1996). To estimate the concentration of contaminants in invertebrate prey consumed by the mouse, the following equations from Tables 5.2 (USEPA, 2005 and 2007) were used to predict these values from the observed soil concentration.

$$\text{Arsenic (invertebrates)} = \exp(0.707 * \ln(\text{Soil}_{conc}) - 1.421$$

$$\text{Manganese (invertebrates)} = \exp(0.682 * \ln(\text{Soil}_{conc}) - 0.809$$

Table 7-7. Contaminant Exposure, Reference Values, and Hazard Quotients for Mouse Receptor

COPEC	UCL95 Soil Conc (mg/kg) Detects	Soil-to-plant accumulation factor	Exposure (mg/kg/d)	Toxicity Reference Value (mg/kg/d)	Hazard Quotient (HQ)
Arsenic	55.6	0.0372	0.329	1.04	0.32
Manganese	29,584	0.079	206.79	51.5	4.02

Notes:
mg/kg/d milligrams per kilogram per day
Uptake parameters: body weight 0.022 kg, plant ingestion 0.00118 kg/d, invertebrate ingestion 0.00176 kg/d, soil ingestion 0.00006 kg/d
All model parameters were taken from USEPA ecological SSL documents.
Concentration in invertebrates estimated using formulas given in SSLs based on soil concentrations.

Table 7-8. Contaminant Exposure, Reference Values, and Hazard Quotients for Dove Receptor

COPEC	95% UCL Soil Concentration (mg/kg)	Soil-to-plant accumulation factor	Exposure (mg/kg/d)	Toxicity Ref Value (mg/kg/d)	Hazard Quotient
Arsenic	55.6	0.0372	0.932	1.55	0.42
Manganese	29,584	0.079	629.93	179.00	3.52

Notes:
mg/kg/d milligrams per kilogram per day
Uptake parameters: body weight 0.157 kg, plant ingestion 0.017 kg/d, invertebrate ingestion 0.00 kg/d, soil ingestion 0.002 kg/d
All model parameters were taken from US EPA ecological SSL documents.

The resulting HQs for arsenic exposure for both the mouse (0.32) and the dove (0.42) are less than 1.0. As the 95% UCL concentrations for arsenic at the other DUs are less than that used in the model, HQs for the other two DU sites would be even lower than the model outputs. These results

support the preliminary contention from Step 2 of the SLERA that arsenic is not an issue for animal receptors at the Depot (Section 7.2.3.1).

The resulting HQs for manganese exposure for the mouse (4.02) and the dove (3.52) exceed the HQ threshold of 1.0 but are less than 10 and thus indicate only low risk. The endpoint used in establishing the NOAEL levels in the SSL assessment for manganese (USEPA, 2007) for both species was growth and reproduction.

The manganese concentration used in the modeling (29,584 mg/kg) was from DU 3. This concentration is roughly five times greater than the 95% UCL for DU 1 (6,250 mg/kg), and about ten times greater than the 95% UCL for DU 2 (2,764 mg/kg) (Table 7-4). If the two species were modeled using these lesser concentrations, the resulting HQs would lower. Consequently, the preliminary conclusion regarding manganese reached from Step 2 of the SLERA is supported by this Step 3A modeling; i.e., the combined weight-of-evidence evaluation indicates a low level of concern at DU 3 and no concern at DU 1 or DU 2 (Table 7-9).

7.2.5 Weight of Evidence

Unlike most other heavy metals, manganese is an essential nutrient for plants and animals. Consequently, analyses of risk associated with exposure to manganese can benefit from a review of findings from Steps 1, 2, and 3A and weight-of-evidence approach (Table 7-9). Manganese concentrations within DU 1 and DU 2 are elevated with respect to background concentrations but are within the range of manganese known to occur naturally in soils (Shacklette and Boerngen, 1984). Not all manganese in soil is expected to be bioavailable; hence, total concentrations in soil likely over-estimate the risk of exposure to manganese by vegetation and animals. Use of the 95% UCL estimates of the mean concentrations of manganese in soil indicates only a low risk to birds and mammals, and use of the mean concentrations indicates no unacceptable risk to birds or mammals. On-site visual inspections of the vegetation within DU 1 and DU 2 did not indicate signs of stress from excessive manganese. Consequently, it is expected that manganese concentrations in soils at DU 1 and DU 2 do not constitute any significant risk to the biota.

In contrast to the situation at DU 1 and DU 2, manganese concentrations within DU 3 are extremely high. Even the mean concentrations within DU 3 are higher than the highest reported naturally-occurring concentrations in soil (Shacklette and Boerngen, 1984). On-site visual inspections of the vegetation within DU 3 suggest less vigorous growth than within surrounding areas (although there may be other factors affecting vegetation growth in this DU). HQs for all categories are in excess of 1.0, even when mean concentrations rather than 95% UCL concentrations, are used. HQs for plants are extremely high. Consequently, manganese concentrations within DU 3 may constitute a risk to the biota.

Table 7-9. Summary of Weight-of-Evidence Evaluation for Exposure to Manganese in Soil by Ecological Receptors

Criteria	DU 1	DU 2	DU 3
Essential nutrient for plants and animals	95% UCL concentration within ranges occurring in native soils.	95% UCL concentration within ranges occurring in native soils.	95% UCL concentration greater than ranges in native soils.
	Mean concentration within ranges occurring in native soils.	Mean concentration within ranges occurring in native soils.	Mean concentration greater than ranges in native soils.
95% UCL concentration compared with SSL	Plant HQ = 28.0	Plant HQ = 12.6	Plant HQ = 134
	Invert HQ = 13.7	Invert HQ = 6.14	Invert HQ = 65.7
	Bird HQ = 1.43	Bird HQ < 1	Bird HQ = 6.88
	Mammal HQ = 1.54	Mammal HQ < 1	Mammal HQ = 7.40
Highest overall 95% UCL concentration (DU 3) in Uptake model with AUF of 100%	--	--	Dove HQ = 3.52
			Mouse HQ = 4.02
95% UCL concentration in uptake model with AUF of 100%	Dove HQ < 1	Dove HQ < 1	Dove HQ = 3.52
	Mouse HQ < 1	Mouse HQ < 1	Mouse HQ = 4.02
Mean concentration compared with SSL	Plant HQ = 12.5	Plant HQ = 8.85	Plant HQ = 86

	Bird HQ < 1	Bird HQ < 1	Bird HQ = 4.41
	Mammal HQ < 1	Mammal HQ < 1	Mammal HQ = 4.74
Visual inspection of vegetation	No visual evidence of stress	No visual evidence of stress	Vegetation appears stunted.

Native soil concentrations and ranges as given by Shacklette and Boerngen, 1984.
AUF - Area Use Factor
HQ - hazard quotient
SSL - ecological soil screening level
"--" not evaluated

7.2.6 SLERA Summary

Ecological SSLs for arsenic and manganese were used to calculate screening level HQs for ecological receptors (plants, soil invertebrates, birds, and mammals) by comparing the SSLs with maximum concentrations and 95% UCL estimates of the mean at DU 1, DU 2, and DU 3.

- For arsenic, the HQ values indicate that the risk levels at DU 1, DU 2, and DU 3 are low (i.e., no HQ exceeds 10).
- For manganese,
  - risk levels at DU 1 are considered moderate for plants and soil invertebrates, and low for birds and mammals. The weight of evidence suggests that manganese is not a significant risk to ecological receptors in DU 1.

- risk levels at DU 2 are considered moderate for plants, low for soil invertebrates, and no threat for birds and mammals. The weight of evidence suggests that manganese is not a significant risk to ecological receptors in DU 2.
- risk levels at DU 3 are considered high for plants, moderate for soil invertebrates, and low for birds and mammals. The weight of evidence suggests that manganese is potentially a significant risk to ecological receptors in DU 3.

Although the overall ecological risk in DU 1 and DU 2 are unlikely, review of individual SU sampling data for DUs 1 and 2 reveal an apparent pattern of significantly elevated concentrations of manganese in soil in the southwestern-most 2 SUs of DU 2 (SU11A and SU12A) and 3 adjacent SUs of DUI (SU12A/B, SU15a, and SU18A). In addition, sampling results for four DU 1 SUs (SU23A, SU24A, and SU37A/B) exhibit manganese concentrations in soil that may adversely impact ecological receptors.

For this SLERA, conservative, health protective assumptions were used to calculate screening level HQs (Table 7-4), consistent with USEPA guidance. For example, the relative bioavailability of contaminants at the Depot was assumed to be 100%; however, contaminants in environmental media generally are less available to biological organisms than they are in experimental media (i.e., food, water, nutrients). Also, while the foraging factors were assumed to be one (1.0) for the SLERA, site foraging factors for many site-specific receptors generally are less than one; i.e., the receptors spend only part of the time at places within the site that contain elevated chemical concentrations. The net effect is that these conservative assumptions, in general, result in overestimation of the risks to the ecological receptors, and additional evaluation may be needed to clearly characterize potential ecological risks.

This Page Intentionally Left Blank

8.0 REVISED CONCEPTUAL SITE MODEL

Soil sampling results indicate that a contaminant source of arsenic and manganese is present in both the surface and subsurface soil. Transport processes include air (e.g., dust) and soil transport via surface water flow. The primary human receptors, based on current and future land use at the Depot, are current and future site workers, construction workers, and trespassers. It is unlikely that the site will have future residential receptors because the Depot is zoned for industrial use and is within an industrial area. Ecological receptors include plants, invertebrates, birds, and mammals. However, the Depot does not contain any areas managed for ecological purposes. Exposure to arsenic and/or manganese may occur via ingestion, inhalation, and dermal contact.

Site groundwater, sediment, and surface water were evaluated in a previous RI report and the pathways to human and ecological receptors to arsenic and manganese in groundwater, sediment, and surface water were determined to be incomplete.

Based on the previously conducted RI, the soil sampling results from this investigation, and the conclusions of the HHRA and SLERA for arsenic and manganese in site soil, the CSM for soil at each of the site DUs has been updated.

8.1 DU 1

Surface and subsurface soil sampling results in DU 1 were consistent with the sources of arsenic and manganese identified in the preliminary CSM (Section 3.1.1). Surface and subsurface soil sampling results were greater than project screening levels at DU 1. Therefore, ERT conducted an HHRA and SLERA for DU 1. The HHRA concluded that there are non-carcinogenic risks to the future resident child for exposure to DU 1 soil. No unacceptable carcinogenic risks were identified to any receptor at DU 1. The SLERA concluded that the combined weight-of-evidence evaluation indicates no ecological concern due to manganese or arsenic at DU 1. Although the DU-wide ecological risks are unlikely, individual SUs exhibiting high manganese concentrations were noted in the SLERA (Section 7.2.6) where unacceptable ecological risks may be present.

Therefore, the complete pathways for DU 1 are to the future resident child. An updated CSM for DU 1 is shown in Appendix A, Figure 13.

8.2 DU 2

Surface and subsurface soil sampling results in DU 2 were consistent with the sources of arsenic and manganese identified in the preliminary CSM (Section 3.1.1). Surface and subsurface soil sampling results were greater than project screening levels at DU 2. Therefore, ERT conducted an HHRA and SLERA for DU 2. The HHRA concluded that there are non-carcinogenic risks to the future resident child for exposure to DU 2 soil. Carcinogenic risks were greater than the acceptable incremental risk for the resident adult and the resident child exposed to DU 2 soil. The SLERA concluded that the combined weight-of-evidence evaluation indicates no ecological concern due to manganese or arsenic at DU 2. Although the DU-wide ecological risks are unlikely, individual SUs exhibiting high manganese concentrations were noted in the SLERA (Section 7.2.6) where unacceptable ecological risks may be present.

Therefore, the complete pathways for DU 2 are to the future resident child and future resident adult. An updated CSM for DU 2 is shown in Appendix A, Figure 13.

8.3 DU 3

Surface and subsurface soil sampling results in DU 3 were consistent with the sources of arsenic and manganese identified in the preliminary CSM (Section 3.1.1). Surface and subsurface soil sampling results were greater than project screening levels at DU 3. Therefore, ERT conducted an HHRA and SLERA for DU 3. The HHRA concluded that there are non-carcinogenic risks to the future resident child, future resident adult, site workers, and future construction workers for exposure to DU 3 soil. Carcinogenic risks were greater than the acceptable incremental risk for the resident child exposed to DU 3 soil. The combined weight-of-evidence evaluation indicates a moderate to high level of ecological concern due to manganese and no ecological concern due to arsenic at DU 3.

Therefore, the complete pathways for DU 3 are to all four modeled human receptors and to site biota (plants and invertebrates). An updated CSM for DU 3 is shown in Appendix A, Figure 14.

9.0 RI CONCLUSIONS AND RECOMMENDATIONS

The goal of the RI was to determine the nature and extent of arsenic and/or manganese contamination at the Depot, potentially caused by prior DoD operations, and to recommend whether further environmental management decisions are warranted.

Arsenic and manganese field sampling activities were completed in April and May 2019. IS soil sampling included collecting surface and subsurface soil samples from 87 SUs in three DUs and surface and subsurface soil samples from seven background SUs.

9.1 Conclusions

ISM soil samples were collected from the surface and subsurface soil in 87 site SUs (59 in DU 1, 18 in DU 2, and 10 in DU 3). Sampling results were greater than the human health and/or ecological screening levels for arsenic and/or manganese at all three DUs. There were sufficient data to evaluate the risks to human health and to the environment, and both a HHRA and a SLERA were completed to quantify the risks.

Site soil sampling results were greater than the PSLs in all three site DUs in the surface and subsurface soil samples, indicating that releases of arsenic and manganese have likely occurred at all three DUs.

Although the Depot is zoned for industrial use, the USEPA RSLs for residential soil were used in this RI to evaluate the risks to future hypothetical resident receptors (child and adult) to support the development of an alternative in the FS, if required, that includes residential land use. A residential cleanup alternative is typically developed so that DoD can consider the measures necessary to allow "unrestricted use/unrestricted exposure" of the land.

The HHRA quantitatively evaluated the risks to human health for the resident child, resident adult, site worker, and construction worker. The trespasser site receptor risks would be equal to or less than the site worker risks. For DU 1 and DU 2, the only receptors for which human health risks were identified are the resident child and resident adult. For DU 3, human health risks were identified for all four receptors. For current and future site workers or future construction workers, non-cancer hazards exist from exposure to surface and combined surface/subsurface soil impacted by manganese. Although it is unlikely that the site will be developed for residential use in the future, this evaluation included a potential future use of the land as residential to support the FS. For the future residential child, surface/subsurface soil impacts by arsenic and manganese in all three DUs may result in non-cancer hazard and/or cancer risk above the acceptable values. For the future residential adult, surface/subsurface soil impacts by arsenic and manganese at DU2 and DU3 may result in non-cancer hazard or cancer risk above the acceptable limits. Table 9-1 summarizes the conclusions of the HHRA for each DU at the Depot.

Table 9-1. HHRA Conclusions for Former Curtis Bay Depot Arsenic and Manganese RI

Decision Unit	DU 1	DU 2	DU 3
Future Resident Child	**Unacceptable Non-Carcinogenic Risks Due to Manganese**	**Unacceptable Carcinogenic Risks Due to Arsenic** **Unacceptable Non-Carcinogenic Risk Due to Manganese**	**Unacceptable Carcinogenic Risks Due to Arsenic** **Unacceptable Non-Carcinogenic Risk Due to Manganese**
Future Resident Adult	No Risks Identified	**Unacceptable Carcinogenic Risks Due to Arsenic**	**Unacceptable Non-Carcinogenic Risk Due to Manganese**
Current and Future Site Workers	No Risks Identified	No Risks Identified	**Unacceptable Non-Carcinogenic Risk Due to Manganese**
Current and Future Construction Workers	No Risks Identified	No Risks Identified	**Unacceptable Non-Carcinogenic Risk Due to Manganese**

Legend:
Bold text indicates unacceptable human health risks (i.e., Carcinogenic Risks > 10^{-5}; Non-carcinogenic HI > 1).

ERT conducted a SLERA in accordance with USEPA guidance for each site DU. Based on the results of the SLERA for the Depot, significant ecological impacts due to the presence of arsenic in soils at all three DU sites are unlikely. Based on the results of the SLERA for the Depot, potentially significant ecological impacts due to the presence of manganese require further examination. Table 9-2 summarizes the conclusions of the SLERA for each DU at the Depot.

Table 9-2. SLERA Conclusions for Former Curtis Bay Depot Arsenic and Manganese RI

Decision Unit	DU 1	DU 2	DU 3
SLERA HQ Arsenic*	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely
SLERA HQ Manganese*	Ecological Impacts Are Unlikely	Ecological Impacts Are Unlikely	**Ecological Impacts are Likely**

Legend:
* *Based on the 95% Upper Confidence Limit of the mean.*
HQ Hazard Quotient

The Step 3A evaluated the arsenic and manganese ingestion modeling for two animal receptor species known to occur on-site and which are known to be sensitive to the chemicals in question: the white-footed mouse and the mourning dove. Results of the Step 3A modeling confirmed the SLERA conclusions for arsenic and manganese.

Although the overall ecological risk in DU 1 and DU 2 are unlikely, review of individual SU sampling data for DUs 1 and 2 reveal an apparent pattern of significantly elevated concentrations of manganese in soil in the southwestern-most 2 SUs of DU 2 (SU11A and SU12A) and 3 adjacent

SUs of DU 1 (SU12A/B, SU15A, and SU18A). It is recommended that this area be evaluated in the FS for remedial action to protect ecological receptors in the vicinity of these SUs.

There are additional DU 1 SUs (SU23A, SU24A, and SU37A/B) where manganese concentrations in soil may adversely impact ecological receptors. It is recommended that these DU 1 SUs be evaluated in the FS for remedial action to protect ecological receptors.

9.2 Recommendations

9.2.1 DU 1 A/B

Based on the results of the HHRA and SLERA, potential risks to human health and potential ecological risks in select SUs due to manganese contamination in surface (DU 1A) and subsurface (DU 1B) soil exist in DU 1. Therefore, further action is warranted to address the manganese impacts to DU 1 soil. An FS is recommended to evaluate the remedial alternatives to address the potential risks to human health and the environment from manganese in the DU 1 soil.

9.2.2 DU 2 A/B

Based on the results of the HHRA and SLERA, potential risks to human health due to arsenic and/or manganese contamination in surface (DU 2A) and subsurface (DU 2B) soil exist in DU 2 and potential ecological risks due to manganese contamination in surface soil in select SUs. Further action is warranted to address the arsenic and manganese impacts to soil at DU 2. An FS is recommended to evaluate the remedial alternatives to address the potential risks to human health and the environment from arsenic and/or manganese in the DU 2 soil.

9.2.3 DU 3 A/B

Based on the results of the HHRA and SLERA, potential risks to human health and/or the environment due to arsenic and/or manganese contamination in surface (DU 3A) and subsurface (DU 3B) soil exist in DU 3. Further action is warranted to address the arsenic and manganese impacts to soil at DU 3. An FS is recommended to evaluate the remedial alternatives to address the potential risks to human health and the environment from arsenic and manganese in the DU 3 soil.

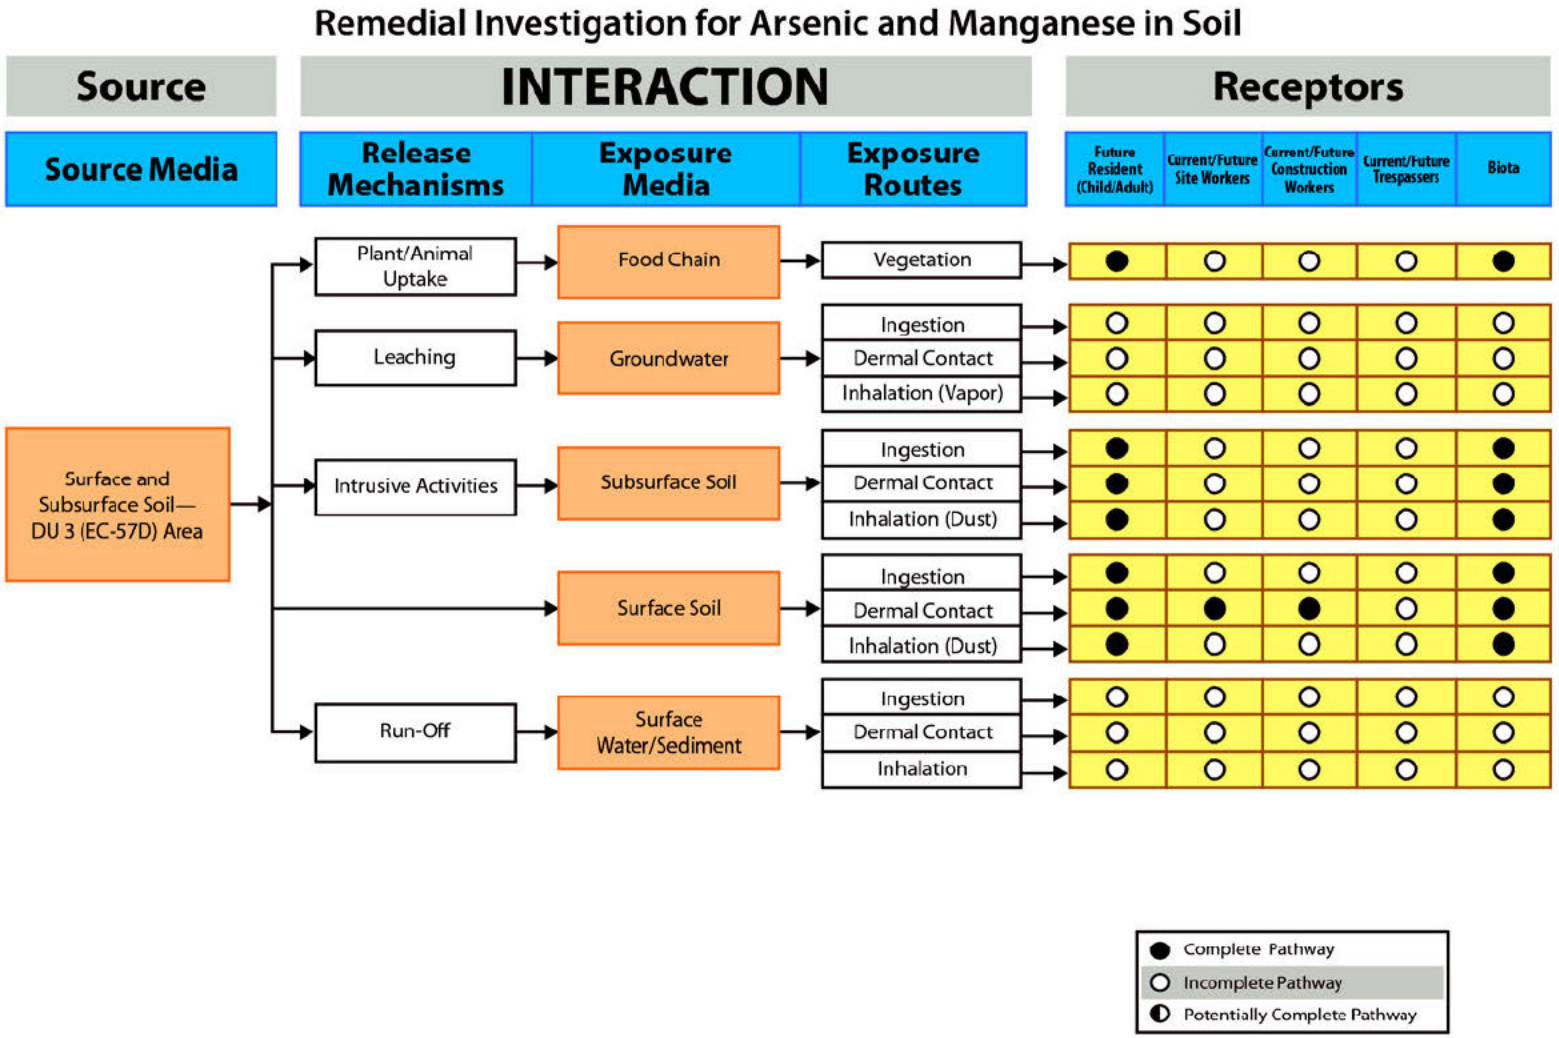
Remedial Investigation for Arsenic and Manganese in Soil



US Army Corps of Engineers® BUILDING STRONG®

ERT

Note: Although DU-wide ecological risks are unlikely, the elevated manganese concentrations in the DU 1 SUs (SU12A/B, SU15A, SU18A, SU23A, SU24A, and SU37A/B) and the DU 2 SUs (SU11A and SU12A) may represent an ecological risk in these areas. Remedial alternatives for ecological risks within these SUs are recommended for evaluation in the FS.

Figure 13
Revised Conceptual Site Model for DU 1 and DU 2
Former Curtis Bay Ordnance Depot
Anne Arundel County, Maryland

Date: April 2021

US Army Corps of Engineers®
BUILDING STRONG®

ERT

Note: The total Hazard Index (1.6) for the Construction Worker receptor to the combined surface/subsurface soil at DU 3 was greater than 1, but no individual exposure routes Hazard Quotients exceeded 1.

CAS Number	Chemical	Minimum Detected Concentration	Minimum Qualifier	Maximum Detected Concentration	Maximum Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Concentration Used for Screening	Background Value (1)	Screening Toxicity Value (2)		COPC Flag	Rationale for Contaminant Deletion or Selection (3)
7440-38-2	Arsenic	0.91	--	55.1	--	mg/Kg	DU1A-SU18	59/59	55.1	3.197	0.68	c	Y	ARSL
7439-96-5	Manganese	107	--	27,700	--	mg/Kg	DU1A-SU12	59/59	27,700	283.3	900	n	Y	ARSL

Notes:

(1) Based on soil values obtained at DU4 in March/April 2019.

(2) RSL - USEPA Residential Soil Regional Screening Level, November 2018
(Cancer benchmark value = E-06, HQ = 0.5 unless otherwise indicated).
Residential Soil Regional Screening Levels were used as screening values for surface soil COPC determination.

(3) COPC Selection Rationale:

ABL = Above Background Level
BBL = Below Background Level
ARSL = Above EPA Residential RSL
BRSL = Below EPA Residential RSL

c Carcinogenic
n Non-Carcinogenic
-- No qualifier
Y Yes
N No

Surface and Combined Surface/Subsurface Soil Data and COPC Screening Tables – DU 2

(Page intentionally left blank)

Table B.1-1 (DU 2). Selection of Exposure Pathways
Former Curtis Bay Ordnance Depot
Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1'), Surface/Subsurface Soil (0-2')
Exposure Point: DU 2

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Onsite/Offsite	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current	Soil	Surface Soil	Surface Soil at DU 2	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Site Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Outdoor site worker could occur on the site both currently and in the future
				Trespasser	Adolescent	Dermal Ingestion Inhalation	Y	Qualitative	Trespassers could occur on the site both currently and in the future
		Surface/ Subsurface Soil	Surface/ Subsurface Soil at DU 2	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
Future	Soil	Surface Soil	Surface Soil at DU 2	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Site Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Outdoor site worker could occur on the site both currently and in the future
				Trespasser	Adolescent	Dermal Ingestion Inhalation	Y	Qualitative	Trespassers could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
		Surface/ Subsurface Soil	Surface/ Subsurface Soil at DU 2	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE

Table B.1-2a (DU 2). Occurrence, Distribution and Selection of Chemicals of Potential Concern

Former Curtis Bay Ordnance Depot

Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1 ft bls)
Exposure Point: DU 2

CAS Number	Chemical	Minimum Detected Concentration	Minimum Qualifier	Maximum Detected Concentration	Maximum Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Concentration Used for Screening	Background Value (1)	Screening Toxicity Value (2)		COPC Flag	Rationale for Contaminant Deletion or Selection (3)
7440-38-2	Arsenic	4.1	--	118.78	--	mg/Kg	DU2A-SU07	18/18	118.78	3.197	0.68	c	Y	ARSL
7439-96-5	Manganese	186	--	7,010	--	mg/Kg	DU2A-SU12	18/18	7,010	283.3	900	n	Y	ARSL

Notes:

(1) Based on soil values obtained at DU4 in March/April 2019.

(2) RSL - USEPA Residential Soil Regional Screening Level, November 2018
(Cancer benchmark value = E-06, HQ = 0.5 unless otherwise indicated)
Residential Soil Regional Screening Levels were used as screening values for surface soil COPC determination

(3) COPC Selection Rationale:
ABL = Above Background Level
BBL = Below Background Level
ARSL = Above EPA Residential RSL
BRSL = Below EPA Residential RSL

c Carcinogenic
n Non-Carcinogenic
-- No qualifier
Y Yes
N No

Table B.1-2b (DU 2). Occurrence, Distribution and Selection of Chemicals of Potential Concern

Former Curtis Bay Ordnance Depot

Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface/Subsurface Soil (0-2 ft bls)
Exposure Point: DU 2

CAS Number	Chemical	Minimum Detected Concentration	Minimum Qualifier	Maximum Detected Concentration	Maximum Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Concentration Used for Screening	Background Value (1)	Screening Toxicity Value (2)		COPC Flag	Rationale for Contaminant Deletion or Selection (3)

Surface and Combined Surface/Subsurface Soil Data and COPC Screening Tables – DU 3

(Page intentionally left blank)

Table B.1-1 (DU 3). Selection of Exposure Pathways
Former Curtis Bay Ordnance Depot
Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1'), Surface/Subsurface Soil (0-2')
Exposure Point: DU 3

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Onsite/Offsite	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current	Soil	Surface Soil	Surface Soil at DU 3	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Site Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Outdoor site worker could occur on the site both currently and in the future
				Trespasser	Adolescent	Dermal Ingestion Inhalation	Y	Qualitative	Trespassers could occur on the site both currently and in the future
		Surface/ Subsurface Soil	Surface/ Subsurface Soil at DU 3	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
Future	Soil	Surface Soil	Surface Soil at DU 3	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Site Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Outdoor site worker could occur on the site both currently and in the future
				Trespasser	Adolescent	Dermal Ingestion Inhalation	Y	Qualitative	Trespassers could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
		Surface/ Subsurface Soil	Surface/ Subsurface Soil at DU 3	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE

Table B.1-2a (DU 3). Occurrence, Distribution and Selection of Chemicals of Potential Concern

Former Curtis Bay Ordnance Depot

Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1 ft bls)
Exposure Point: DU 3

CAS Number	Chemical	Minimum Detected Concentration	Minimum Qualifier	Maximum Detected Concentration	Maximum Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Concentration Used for Screening	Background Value (1)	Screening Toxicity Value (2)		COPC Flag	Rationale for Contaminant Deletion or Selection (3)
7440-38-2	Arsenic	6.3	--	45.14	--	mg/Kg	DU3A-SU03	10/10	45.14	3.197	0.68	c	Y	ARSL
7439-96-5	Manganese	867	--	48,800	--	mg/Kg	DU3A-SU04	10/10	48,800	283.3	900	n	Y	ARSL

Notes:

(1) Based on soil values obtained at DU4 in March/April 2019.

(2) RSL - USEPA Residential Soil Regional Screening Level, November 2018
(Cancer benchmark value = E-06, HQ = 0.5 unless otherwise indicated)
Residential Soil Regional Screening Levels were used as screening values for surface soil COPC determination

(3) COPC Selection Rationale:
ABL = Above Background Level
BBL = Below Background Level
ARSL = Above EPA Residential RSL
BRSL = Below EPA Residential RSL

c Carcinogenic
n Non-Carcinogenic
-- No qualifier
Y Yes
N No

Table B.1-4d (DU 3). Values Used for Exposure Calculations (Surface/Subsurface Soil, Resident Child)

Former Curtis Bay Ordnance Depot

Anne Arundel County, Maryland

Scenario Timeframe: Potential Future
Medium: Soil
Exposure Medium: Surface/Subsurface Soil (0-2 ft bls)
Exposure Point: DU 3
Receptor Population: Resident
Receptor Age: Child

Exposure Route	Parameter Code	Parameter Definition	Units	RME Value	RME Rationale / Reference	Intake Equation / Model Name
Ingestion	AT-C	Averaging Time (Cancer)	days	25,550	EPA 1989 (70 years*365 days/year)	Chronic Daily Intake (CDI) (mg/kg-day) =
	AT-N	Averaging Time (Non-Cancer)	days	2,190	EPA 1989 (6 years*365days/year)	CS x IR x EF x ED x CF x FI /BW /AT
	CS	Chemical Concentration in Soil	mg/kg	EPC in Table 3a/b	See Table 3a/b	
	BW	Body Weight	kg	15	EPA 2014	
	CF	Conversion Factor	kg/mg	1.0E-06	EPA, 1989	
	ED	Exposure Duration	yr	6	EPA 2014	
	EF	Exposure Frequency	days/year	350	EPA 2014	
	ET	Exposure Time	hr/day	24	EPA 2014	
	FI	Fraction from Contaminated Source	unitless	0.25	Assumed	
	IRo	Ingestion Rate	mg/day	200	EPA, 2002	
Dermal	AT-C	Averaging Time (Cancer)	days	25,550	EPA 1989 (70 years*365 days/year)	CDI=
	AT-N	Averaging Time (Non-Cancer)	days	2,190	EPA 1989 (6 years*365days/year)	CS x SA x AF x DA x CF x EF x ED /BW /AT
	BW	Body Weight	kg	15	EPA 2014	
	CF	Conversion Factor	kg/mg	1.0E-06	EPA, 1989	
	CS	Chemical Concentration in Soil	mg/kg	EPC in Table 3a/b	See Table 3a/b	
	ED	Exposure Duration	yr	6	EPA 2014	
	EF	Exposure Frequency	days/year	350	EPA 2014	
	ET	Exposure Time	hr/day	24	EPA 2014	
	AF	Adherence Factor	mg/cm^2	0.2	EPA 2014	
	SA	Skin Surface Area	cm^2	2,373	EPA 2014 (for head, hands, forearms, lower legs, and feet)	
	DA	Dermal Absorption Fraction	unitless	0.03 0.01	for Arsenic (EPA 2004) for Manganese (EPA Region 3)	
Inhalation	AT-C	Averaging Time (Cancer)	days	25,550	EPA 1989 (70 years*365 days/year)	Air Exposure Concentration (EC) (mg/m^3) =
	AT-N	Averaging Time (Non-Cancer)	days	2,190	EPA 1989 (6 years*365days/year)	Cair x ET x EF x ED /AT
	BW	Body Weight	kg	15	EPA 2014	
	CS	Chemical Concentration in Soil	mg/kg	EPC in Table 3a/b	See Table 3a/b	
	Cair	Chemical Concentration in Air	mg/m^3		CS/PEF	
	PEF	Particulate Emission Factor	m^3/kg	4.63E+09	EPA 1989	
	ED	Exposure Duration	yr	6	EPA 2014	
	EF	Exposure Frequency	days/year	350	EPA 2014	
	ET	Exposure Time	24hr/24hr	1.0	EPA 2014

Attachment D

Surface and Combined Surface/Subsurface Soil Data and COPC Screening Tables – DU 4

(Page intentionally left blank)

Table B.1-1 (DU 4). Selection of Exposure Pathways
Former Curtis Bay Ordnance Depot
Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1'), Surface/Subsurface Soil (0-2')
Exposure Point: DU 4

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Onsite/Offsite	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current and Future	Soil	Surface Soil	Surface Soil at DU 4	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Site Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Outdoor site worker could occur on the site both currently and in the future
				Trespasser	Adolescent	Dermal Ingestion Inhalation	Y	Qualitative	Trespassers could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
		Surface/ Subsurface Soil	Surface/ Subsurface Soil at DU 4	Construction Worker	Adult	Dermal Ingestion Inhalation	Y	Quantitative	Construction could occur on the site both currently and in the future
				Residential	Child	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE
					Adult	Dermal Ingestion Inhalation	Y	Quantitative	Potential future resident receptors, included at the direction of MDE

Table B.1 -2a (DU 4). Occurrence, Distribution and Selection of Chemicals of Potential Concern

Former Curtis Bay Ordnance Depot

Anne Arundel County, Maryland

Scenario Timeframe: Current and Future
Medium: Soil
Exposure Medium: Surface Soil (0-1 ft bls)
Exposure Point: DU 4

CAS Number	Chemical	Minimum Detected Concentration	Minimum Qualifier	Maximum Detected Concentration	Maximum Qualifier	Units	Location of Maximum Concentration	Detection Frequency	Concentration Used for Screening	Background Value (1)	Screening Toxicity Value (2)		COPC Flag	Rationale for Contaminant Deletion or Selection (3)
7440-38-2	Arsenic	1.2	--	4.529	--	mg/Kg	DU3A-SU03	10/10	4.529	3.197	0.68	c	Y	ARSL
7439-96-5	Manganese	85.9	--	334	--	mg/Kg	DU3A-SU04	10/10	334	283.3	900	n	N	BRSL

Notes:

(1) Based on soil values obtained at DU4 in March/April 2019.

(2) RSL - USEPA Residential Soil Regional Screening Level, November 2018
(Cancer benchmark value = E-06, HQ = 0.5 unless otherwise indicated)
Residential Soil Regional Screening Levels were used as screening values for surface soil COPC determination

(3) COPC Selection Rationale:
ABL = Above Background Level
BBL = Below Background Level
ARSL = Above EPA Residential RSL
BRSL = Below EPA Residential RSL

c Carcinogenic
n Non-Carcinogenic
-- No qualifier
Y Yes
N No

Table B.1-2b (DU 4). Occurrence, Distribution and Selection of Chemicals of Potential Concern

Suggested UCL to Use			
95% Student's-t UCL	18.52		
Recommended UCL exceeds the maximum observation			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

Suggested UCL to Use			
95% Student's-t UCL	3.837		
Recommended UCL exceeds the maximum observation			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be			
reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.			

UCL Statistics for Uncensored Full Data Sets - DU 1B-SU44

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.			
ProUCL computes and outputs H-statistic based UCLs for historical reasons only.			
H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.			
It is therefore recommended to avoid the use of H-statistic based 95% UCLs.			
Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

18 July 2019 Ecological Site Visit Memorandum

(Page intentionally left blank)

MEMORANDUM

Date: July 30, 2019
To: ERT, Inc.
From: [redacted] Ph.D., HSW Engineering, Inc. (HSW)
RE: Former Curtis Bay Depot
Project Title: Ecological Site Visit Conducted July 18, 2019
HSW Project No.: [redacted]

An ecological site visit was conducted on July 18, 2019, by Ms. [redacted] (ERT, Inc.), Ms. [redacted] (HSW), and Dr. [redacted] (HSW). The primary objective of this field reconnaissance was to provide updated information to confirm or supplement more detailed field work conducted in 2005 by Parsons, Inc. The reconnaissance team spent approximately five hours on-site.

Each of three Decision Units (DU 1, DU 2, and DU 3) were visited, during which a plant and animal species list was compiled (Table 1). Animal species were identified by tracks observed on the ground and by characteristic calls or songs.

Notable observations from the site visit are as follows.

1. Bradford pear trees were extremely common throughout all three DUs. This appears to be the single largest change in vegetation patterns from 2005 to 2019. Bradford pear is not a native species of tree. It has been spreading prolifically within the region.
2. Old field habitat is gradually being replaced with shrub/forested systems.
3. Overall, vegetation within DU 1 and DU 2 appeared normal. Likewise, no obvious signs of leaf [redacted] were observed within DU 3; however, woody vegetation within DU 3 appeared somewhat stunted in comparison with surrounding areas.
4. Deer were observed frequently.
5. Three active osprey nests were noted.
6. While most or all the site has been altered from its original state, much of the site is undergoing a gradual successional trend away from open field toward wooded habitat types.
7. The entire area comprised 435 acres. This acreage is the largest “undeveloped” acreage within a wide radius.
8. The potential for habitat restoration appears high.
9. As is the case with many secondary succession sites, the influx of invasive exotic species is an issue.

Table 1: Species Observed during July 18, 2019 Field Visit to the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland

Species Observed		Terrestrial System	
		Open Uplands	Forested Uplands
Common Name	Scientific Name	Successional Old Field	Successional Hardwoods
Red maple	*Acer rebrum*	Y	Y
Silver maple	*Acer saccarum*	Y	Y
Tree-of-heaven	*Ailanthes altissima*	Y	Y
Sweet gum	*Liquidambar styraciflua*	Y	Y
Tulip tree	*Liriodendron tulipifera*		Y
Eastern cottonwood	*Populus deltoides*		Y
White oak	*Quercus alba*		Y
Water oak	*Quercus nigra*		Y
Black locust	*Robinia pseudo-acacia*	Y	Y
Bradford pear	*Pyrus calleryana*	Y	Y
Salt bush	*Baccharis halimifolia*	Y	
Red-osier dogwood	*Cornus stolonifera*		Y
Common persimmon	*Diospyros virginiana*	Y

Red raspberry	*Rubus idacus*	Y	Y
Sassafras	*Sassafras albidum*	Y	Y
Butter and Eggs	*Linaria vulgaris*	Y	
Common ragweed	*Ambrosia artimisiifolia*	Y	
Broom sedge	*Andropogon virginicus*	Y	
Shattercane	*Sorghum bicolor*	Y	
Common mugwort	*Artemesia vulgaris*	Y	
Common milkweed	*Asclepias syriaca*	Y	
Calico aster	*Aster lateriflorus*	Y	
Common chickweed	*Cerastium sp.*	Y	
Chicory	*Cichorium intybus*	Y	
Bull thistle	*Cirsium vulgare*	Y	
Devil's tear thumb	*Persicaria perfoliata*	Y	
Orchard grass	*Dactylis glomerata*	Y	
Queen Anne's lace	*Daucus carota*	Y	
Goldenrod	*Solidago sp.*	Y	
Common strawberry	*Fragaria virginiana*	Y	
Common morning glory	*Ipomoea sp.*	Y	
Honeysuckle vine	*Lonicera japonica*	Y	
Catbriar	*Smilax sp.*	Y	
White sweet clover	*Melilotus alba*	Y	
Sensitive fern	*Onoclea sensibilis*	Y	
Panic grass	*Panicum spp.*	Y	Y
Switchgrass	*Panicum virgatum*	Y	
Virginia creeper	*Parthenocissus quinquefolia*	Y	Y
Bracken fern	*Pteridium latiusculum*	Y	
Wild rose	*Rosa carolina*	Y	
Blackberry	*Rubus sp.*	Y	
Little bluestem	*Schizachyrium scoparium*	Y	
Blue-eyed grass	*Sisyrinchium graminoides*	Y	
Dandelion	*Taraxacum officinale*	Y	
Poison ivy	*Toxicodendron radicans*	Y	Y

Species Observed		Terrestrial System	
		Open Uplands	Forested Uplands
Common Name	**Scientific Name**	**Successional Old Field**	**Successional Hardwoods**
White clover	*Trifolium repens*	Y	
Virginia chain fern	*Woodwardia virginica*		Y
Wild grape	*Vitis sp.*	Y	Y
Canada goose	*Branta canadensis*	Y	
Northern cardinal	*Cardinalis*	Y	Y
Killdeer	*Charadrius vociferius*	Y	
Common ground dove	*Columbina passerina*	Y	
Black vulture	*Coragyps atratus*	Y	
American crow	*Corvus brachyrhynchos*	Y	Y
Blue jay	*Cyanocitta cristata*		Y
Barn swallow	*Hirundo rustica*	Y	
Mockingbird	*Mimus polyglottos*	Y	
Great crested flycatcher	*Myiarchus crinitus*		Y
Osprey	*Pandion haliaetus*	Y	
European starling	*Sturnus vulgaris*	Y	
Tree swallow	*Tachycineta bicolor*	Y	
Eastern kingbird	*Tyrannus tyrannus*	Y	
Mourning dove	*Zenaida macroura*	Y	
American toad	*Bufo americana*	Y	
White-tailed deer	*Odocoileus virginianus*	Y	Y
Eastern cottontail rabbit	*Sylvilagus floridanus*	Y	

All species listed in the table were observed in successional old field or successional hardwoods systems. Species observed on July 18, 2019, are indicated with "Y".

APPENDIX C: TPP MEETING MINUTES AND CORRESPONDENSES

This Page Intentionally Left Blank

Curtis Bay Site Wide Arsenic/Manganese RI/FS

TPP Meeting #1 – February 15, 2018

Final Meeting Summary

Meeting Attendees:

[redacted] – USACE
[redacted] – GSA
[redacted] DLA
[redacted] – MDE
[redacted] - ERT

Meeting Summary:

After introductions, Mr. [redacted] thanked everyone for coming and stated that there is a lot going on a Curtis Bay, things are starting to come together, and he believes that we have a good plan for moving forward, and addressing any concerns so we can fill data gaps and achieve the property goals. The goals are to investigate and remediate, as needed, all environmental issues at the Former Curtis Bay Depot and divest the property so that is can be utilized for useful purposes.

Ms. [redacted] began the presentation with a review of the agenda. Ms. [redacted] presented the important terminology starting with USEPA technical project planning (TPP) process adopted by USACE. The TPP process ensures that the stakeholders agree on the proposed project processes and goals prior to work plan development. This is TPP meeting #1. There will be additional TPP meetings for this project.

This project is a Remedial Investigation (RI)/Feasibility Study (FS) for determining potential arsenic and manganese impacts to soil at the Former Curtis Bay Depot. The goal is to determine if there are potential unacceptable human health and/or ecological risks due to arsenic and/or manganese at the site and to conduct a feasibility study if potential unacceptable risks are identified to determine potential remedial actions. For this project, we are using the Visual Sample Plan (VSP) program to support determination of the number and location of the random samples. The number of random samples identified by VSP is based on percent confidence required in the data quality objectives (DQOs). Additionally, on this project we will use the incremental sampling methodology (ISM) for collecting soil samples (surface and subsurface). Mr. [redacted] added that because we are conducting sampling using ISM and using the statistical tool VSP there is a larger number of proposed sampling locations for this project than would normally be collected during an RI using discrete methods.

Ms. [redacted] asked if VSP helps to develop the size of the ISM decision units (DUs) in terms of how many there are. Ms. [redacted] responded that VSP does not determine the size or number of DUs. There is a large area of the Former Curtis Bay Depot about which we have very little information, and which likely has the same conceptual site model (CSM). Therefore, we classified that as one decision unit (DU-1). There are two areas, the IRP Shop Area and the EC-57D area where there are several historical discrete sampling data that indicate areas of known impacts. One DU (DU-2 and DU-3) was established for each of these areas based on the historical data. The size of each sampling unit (SU) is based on the current land use – the Depot is an industrial site. We use the DU-1 area, the size of the SU (150 ft by 150 ft), and the required confidence interval (95%) as inputs into VSP. The number of SUs selected by VSP is determined by the confidence interval and VSP randomly selects the SUs.

Ms. [redacted] reviewed the CERCLA process (Slide 6) and identified the process step for this project - the RI phase. Ms. [redacted] also noted that this RI is focused on potential site-wide arsenic and manganese impacts to soil. Additionally, as part of this project, ERT will perform a FS should sampling results and the human

health risk assessment (HHRA)/screening-level ecological risk assessment (SLERA) indicate potential unacceptable human health or environmental risks from arsenic and/or manganese. Mr. [redacted] added that it is important to remember where we are in the CERCLA process as far as cleanup. He noted that the reason that we're doing this project was that as we completed the RI at the environmental concern (EC) sites we were having problems identifying the source of the arsenic. Based on the previously collected data, it became clear that the arsenic and manganese were potentially due to non-point sources. This indicated that the release mechanism was likely wide-spread (as with pesticide use or shifting ore stockpiles), and our sampling methodology was not appropriate for non-point sources. Therefore, the previous RI concluded that arsenic and manganese needed to be evaluated separately from the evaluation of the ECs.

Ms. [redacted] stated that the goal of the RI is to determine if arsenic or manganese have been released to the environment and if there is a complete exposure pathway. A revised CSM will be developed based on data collected during this RI and used in the risk assessment and RI Report. The RI Report will then recommend no further action, a removal action, or a remedial action. Remedial alternatives will be evaluated in the FS. The goals of the TPP are to determine our data needs and data quality, as well as make sure everyone agrees on how and where we are collecting the data.

After TPP #1, we will develop and submit the work plan. After receiving MDE's comments on the work plan, USACE and ERT will schedule TPP #2 to discuss the significant comments and responses before finalizing the work plan. ERT will then conduct the field investigation. Additional TPP meetings may be held to discuss the MDE comments on the Draft Final RI Report and/or the Draft Final FS.

Ms. [redacted] noted that large copies of the TPP presentation figures are provided along with a copy of the TPP presentation. Ms. [redacted] noted that we are all familiar with the location of the Curtis Bay Depot and reviewed the Depot history and previous investigations. The Depot was used between 1918-1950s for the storage, maintenance, and demilitarization of ordinance. In the 1950s the Defense National Stockpile Center started storing ores there as well. These were large stockpiles that were moved around the site frequently. GSA currently owns the Depot. Previous investigations include a preliminary assessment, a focused site investigation (FSI) and an expanded site investigation (ESI) that focused on the ore stockpiles. The Environmental Survey and Analysis Report (ESAR) was published in 2011 that documented the EC sites. The ECs were areas where there was a potential for contamination from munitions and explosives of concern (MEC) or hazardous, toxic, or radioactive waste (HTRW). ERT conducted the field investigations and drafted the Draft Final RI/FS report (which EA is finalizing). Ms. [redacted] added, as Mr. [redacted] previously noted, that the arsenic and manganese data did not conform to the CSM for the EC sites.

Ms. [redacted] noted Slide 11 shows the previous arsenic and manganese results and also shows that some areas have not been sampled previously. The data shown are from the EC RI (ERT) and the ore stockpile FSI and ESI (Parson). Ms. [redacted] clarified that anything red exceeded the screening levels; the red squares are the manganese exceedances (concentrations greater than the USEPA Industrial Soil RSL), and the red dots are the arsenic exceedances (concentrations greater than background level). Mr. [redacted] asked if this was all discrete data and Ms. [redacted] replied that all samples were collected using discrete methods, including the background locations. Ms. [redacted] noted that the purple blocks on Slide 11 are locations of the historical ore stockpiles based on the 1963 aerial photo.

Slide 12 shows the study area which includes the IRP Shop Area (blue outline) and EC-57D (red outline). Ms. [redacted] noted that one area is excluded from this investigation; this is the area where USACE is conducting a non-time critical removal action (NTCRA). Mr. [redacted] noted the goal at EC-25 and EC-49 is to complete the NTRCA and then perform an RI. Ms. [redacted] asked if additional sampling was done for the NTRCA and if arsenic and manganese were identified. Mr. [redacted] replied yes and noted that

everything that was greater than the remedial action goals was removed. Initially, USACE planned to address the material potentially presenting an explosive hazard (MPPEH) and the munitions constituent (MC) contamination. Arsenic was not originally included in the COPCs, but during the development of the work plan arsenic was included as it became apparent arsenic is a potential issue at the Depot. Arsenic contamination is being addressed during the NTRCA and USACE developed a removal goal for arsenic as part of the NTRCA. Anything greater than the removal goal will have been removed at the NTCRA completion. Mr. [redacted] and Mr. [redacted] clarified that the removal action goals were tied to the industrial screening levels.

Ms. [redacted] stated that the objectives of this project are to delineate the arsenic and manganese impacts within the study area, perform a human health risk assessment if the soil sampling results are greater than the RSLs for industrial soil and background soil sampling results. For the HHRA, potential carcinogenic risks will be evaluated using the MDE standard ($1x10^{-5}$), and non-carcinogenic hazards will be evaluated using a hazard index of 0.5 because we only have two analytes. ERT will also perform a SLERA, and then perform a FS, if potential unacceptable risks are identified, to determine appropriate remedial alternatives.

Ms. [redacted] discussed the CSM (Slides 14 and 15). The current investigation area is approximately 425 acres. As discussed, the investigation area does not include the NTCRA area (EC-25 and EC-49). The Depot is located on a peninsula and is partially bounded by Back Creek (west), Furnace Creek (south), and Curtis Creek (east). The Depot is mostly grass with trees, shrubs, and a few small wetland areas dominated by *Phragmites*. An unnamed tributary runs through the Depot. GSA owns the Depot. Currently, the Depot is zoned for industrial use. The future use is anticipated to remain industrial. Site receptors include site workers, construction workers, and trespassers. Ecological receptors include plants, soil, invertebrates, reptiles, amphibians, birds, and mammals.

Potential sources of arsenic include herbicide and pesticide use and the ore stockpiles. The potential source of manganese is the manganese ore that was stored in stockpiles at the Depot. Since these are not point-sources, it is likely that any contamination is due to activities performed throughout the Depot. Additionally, arsenic and manganese could have come from another nearby location. Mr. [redacted] noted that prior to being a depot, there were portions of the Depot that were reportedly apple orchards and pesticides containing arsenic may have been used during that timeframe.

Mr. [redacted] asked about lumber storage as a potential source of arsenic. Ms. [redacted] noted that treated lumber was evaluated as part of the EC investigations. In sampling locations with reported detections of arsenic greater than background, the other metals that are associated with treated lumber, copper and chromium, were not reported at concentrations greater than background. Therefore, treated lumber is not the likely source of arsenic. Mr. [redacted] added that sampling should have resulted in elevated levels of arsenic, copper, and chromium if treated lumber was the source and the lack of elevated copper and chromium indicates an alternative source for the arsenic.

Ms. [redacted] went over the seven steps to develop DQOs, which will be detailed in the work plan.

The problem associated with the site is that previous data indicate that some locations have surface soil arsenic concentrations that are greater than the site background levels, and some areas contain manganese surface soil concentrations that are greater than the RSL. Our goal is to determine the horizontal and vertical extent of any contamination and then determine if any of those areas pose a potential unacceptable risk to human health and/or the environment.

Inputs to the decision include historical arsenic and manganese data. Although these data are from discrete sampling, they were used to guide selection of DUs for ISM sampling. Because site data will be collected using ISM, ERT will conduct an additional background analysis also using ISM. To determine the next

step (no further action, removal action, or remedial action), sampling results will be compared to the larger of the USEPA RSLs for industrial soil and the new site-specific background sampling results. The study area boundary is shown in Slide 12. Surface soil will be collected in the 0 - 1 foot (ft) below ground surface (bgs) interval and subsurface soil will be collected from the 1 – 2 ft bgs interval. Mr. [redacted] asked how far below ground surface groundwater was found. Although this varies across the study area, the average depth is approximately 15 ft bgs.

To make project decisions, ERT will calculate the 95 percent (%) upper confidence limit of the mean (UCL) of the background soil sampling data and compare that to the USEPA RSLs, the project screening level (PSL) will be the greater of these values for each analyte. ERT will calculate the 95% UCL for each DU (using all SU data for that DU). If the DU 95% UCLs are less than the PSL, then no further action will be recommended. If the either of DU 95% UCLs are greater than PSLs, then ERT will conduct an HHRA/SLERA. If potential unacceptable risks to human health and/or the environment are identified, then ERT will conduct an FS.

Ms. [redacted] asked in terms of delineating vertical extent will there be a contingency to go deeper should we find something deeper than the planned sampling intervals. Ms. [redacted] replied yes. During the prior investigation, samples were collected from as deep as five or six feet below ground surface in some areas. However, most of the data show that arsenic and manganese contamination is in the top foot of soil. Ms. [redacted] added that at the IRP Shop Area there were two locations in subsurface soil where arsenic concentrations were greater than the background concentration and we took approximately 20-25 samples in that area.

Ms. [redacted] reviewed the 3 DUs that will be investigated; the study area was separated into these DUs as the CSMs differ for each DU. These areas were determined using the previous sampling results. The IRP Shop Area is DU-2 due to numerous sampling locations where reported results for arsenic were greater than background. The EC-57D area is DU-3, due to sampling locations where reported results for manganese were greater than the USEPA RSL. The rest of the site is DU-1, where there were no clearly impacted areas (as with DU-2 and DU-3).

The overall soil sampling approach is to use the ISM. SUs will be 150 ft by 150 ft and 30 increments will be collected per horizon (surface and subsurface) per SU. Subsurface soil samples will be collected from DU-2 and DU-3. Additional subsurface sampling may be conducted from SUs in DU-1 during a separate mobilization based on surface soil sampling results. All samples will be analyzed for arsenic and manganese.

Soil sampling in DU-2 (IRP Shop Area) will include surface and subsurface soil. Slide 25 shows the IRP Shop Area and the SUs are outlined with a yellow border. Ms. [redacted] asked if the smaller SUs that are on the eastern side of the DU (trapezoid shapes) would be prorated. Ms. [redacted] responded that they will have 30 increments each and Mr. [redacted] added that no matter the size of the SU, the number of increments must be statistically relevant. He noted that in each 150 ft by 150 ft SU, the horizon is 0-1, so the ISM sample will be collected within that interval using 30 increments. Ms. [redacted] added that DU-2 will have subsurface samples collected from the 1-2 ft interval as well. Mr. [redacted] asked if this would be done by hand or with a geoprobe and Mr. [redacted] responded with a geoprobe. Ms. [redacted] asked if we're doing triplicate sampling and Ms. [redacted] responded, yes, at a rate of 10% of the SUs. [redacted] clarified the correct term is replicate and we would be doing 3 replicates at the required frequency.

Ms. [redacted] asked if we were thinking of combining the two partial into a single SU, as the combined SU would be closer to the area of the full-sized SUs. Ms. [redacted] noted we would look at that when preparing the work plan figures. Ms. [redacted] asked about the hatched area and if there was a fence there.

Ms. [redacted] replied that there is a fence there and this is the Army Reserve property, so it's not part of the Curtis Bay Depot. No one knew when it had been separated from the Depot, but it was likely before the ore was stored at the Depot.

Ms. [redacted] started reviewing the plan for DU-3, which is the outline of EC-57D as it was defined in the prior investigation. She noted that during the prior investigation as we went farther north we were getting higher concentrations, rather than lower ones, which would have been the case if the potential contamination was related to the activities in EC-57D. DU-3 is outside of the EC-57D boundary and there were large manganese ore piles stored in this area historically. For DU-3 we are proposing to do both surface and subsurface soil sampling because we did have manganese concentrations in a few subsurface samples that exceeded the screening criteria. The figure shows blue squares for the sampling units, which are 150 by 150 ft, n=30, surface is 0 to 1 foot, and subsurface is one to two feet. If we were to see anything in the subsurface we would conduct additional sampling. Mr. [redacted] asked if the site was being sampled for both arsenic and manganese or just manganese. Ms. [redacted] replied we are doing both, although the release mechanism at this DU is associated with manganese, but this will help us with the Depot-wide arsenic CSM as well.

Ms. [redacted] noted that while the previous investigation used a hazard quotient of 0.1 because of the large number of potential constituents of concern at the time, for this project we are only looking at two potential constituents of concern and are using a 0.5 hazard quotient. Therefore, all figures for this presentation show locations that exceeded the 0.5 screening level. The team agreed to combine a few of the truncated grids.

Ms. [redacted] noted that DU-1 is the rest of the site. On the DU-1 figure, the black squares are the ones that VSP selected as SUs. Mr. [redacted] added that the selected sampling locations have to be random because the model is statistics driven. Ms. [redacted] noted that when you conduct random sampling it means that any sampling grid is equally likely to be selected.

Ms. [redacted] asked if for any of the exceedances that are not in the proposed SUs, if that means that there is not going to be any additional investigation of those locations. Ms. [redacted] replied yes, as VSP did not select those locations for the random, statistically supported SUs. Mr. [redacted] noted that one of our concerns early on with developing the sampling plan was how do we use existing data in a final assessment. Unfortunately, the answer is we can't because it's discrete data and discrete data is notorious for being all over the place. Therefore, we developed a plan that uses sound statistical methods, using ISM methodology, and an adequate number of samples that will more than address the issue. We were able to use the discrete data to help point to where the real problems were, and it allowed us to come up with a plan of how to address the site and if any areas were “different” from the other areas.

Ms. [redacted] added that the one difference for DU-1 is that for all of the SUs we are conducting surface (0-1 foot) soil sampling. Our CSM shows us that if we are going to see contamination it's mainly going to be in the surface soil. However, if any of those surface soil sampling units come back with a potential unacceptable risk in the surface soil then we'll sample and analyze the subsurface soil. This could be done through a second mobilization or the subsurface samples can be collected at the same time and held at the laboratory until it is determined if the samples should be analyzed.

Mr. [redacted] noted that once we get this data, then we have to determine what we are going to do with it. The goal is that the risk assessment will be for the entire DU. Mr. [redacted] added that this is an important point because we are not doing a risk assessment for just one SU, but are generating a potential risk for the entire DU. All SUs will be pooled and the potential risk run on the entire data set. Mr. [redacted] added that discrete data can be misleading and that it depends on how you use it. For IS, from a statistical standpoint each SU result on its own is not relevant because we have established a specific DU, which for this project

are DU-1, DU-2, and DU-3. Again, this is a statistical design, but everyone needs to understand what the outputs are going to be, how we're using the input data, and how we establish the confidence that this approach is going to get us an answer to the question we are asking.

Mr. [redacted] added that the assumption is that our receptors are going to be traversing the whole area, and we have no reason to believe that any one area should be singled out over any other area within DU-1. The good thing about this design is that the aerial extent over which we are sampling (areal coverage) is vastly larger than if we were taking individual grabs, which is the power of ISM versus individual grabs/discrete sampling. If we find a hot spot it's going to be over that 150x150' grid, and the same for vertical extent. If we find it to be hot at one spot then we go down as well, and that fulfills the conditions of the RI for nature and extent.

Ms. [redacted] noted that she was not sure that she concurs with the size of DU-1. She thinks DU-2 and DU-3 make sense, but DU-1 is awfully large and she needs to think about it. Mr. [redacted] noted that the team looked at a bunch of different scenarios and asked how do you put this together. The conclusion was that there are a lot of ways, but they all get to the same end result. Mr. [redacted] added that one of the things to be aware of is the cost consideration. He noted that this is a lot of sampling and is a much greater effort than going to collect the same coverage with grabs. He added that you could theoretically carve DU-1 into 10 DUs and then run 10 risk assessments, but that would cost a lot more money, which is a very practical consideration. Plus, he added, we are looking at industrial receptors, not residential and that went into our planning as well.

Ms. [redacted] added that the samples that were used to develop the sampling approach are not just based on the EC RI; they include the Parsons RI where they evaluated the stockpiles but did not have any large areas of exceedances that were found during their field effort. Mr. [redacted] noted that this map really informed how we did this because we had no reason to believe like we do at the IRP Shop Area and EC-57D that we needed to single out any other given area within DU-1. Specifically, we asked ourselves if anything else jumped out at us, and the answer was no.

Mr. [redacted] stated that we are putting this back into perspective and he is glad we are talking about this because all of the little red dots on the figure are a little misleading. He added that you really have to understand where that data came from; it was discrete metals data in soil, which is notoriously inaccurate, and the sampling was done back in the 90s and 2000s, along with some current data. The whole reason we designed the sampling was that the data showed us that the problem was diffuse. The data that we get from this project will give us normalized data, which will be representative of the DU that we chose. But again, the statistics are telling us that if you do this level of sampling your decision for that area will be a proper evaluation, and there will be a lot of confidence in that. Therefore, you cannot really look at the little red dots and try to say what they mean about where the contamination is because if we could have done that we would have. What this evaluation does say is those little red dots convey that there's a diffuse problem, and it's bigger than this little spot and it's not consistent.

Ms. [redacted] appreciated the explanation and noted that she wants to bring this information back to her counterparts at MDE. Mr. [redacted] agreed with that approach but wanted to make sure that in addition to the map, they need to understand the background of how we got to these DUs and the why of the process. He added it might be best to wait to have those discussions until MDE receives and reviews the work plan, as it will lay out how we got to the 3 different DUs but will not have the old data overlaying the DUs, since as we discussed that is misleading. The plan will discuss how the old data was used and the rationale that went into developing the RI approach.

Mr. [redacted] noted that this is his third time seeing the information, which was hard to digest the first time due to all the data and the size of the Depot. But he feels this gives you the most bang for your buck and a very high confidence level in the data that you're using which is key to whatever we do out there.

Ms. [redacted] asked if the VSP inputs were taking into account where the EC's are. Ms. [redacted] responded no, as we are no longer looking at the Site as EC biased. We are looking at the site as a whole, using random methodology. The team discussed what would happen if you were to move one of the random grids to cover a prior discrete sampled exceedance. While you don't make the data irrelevant by doing that, you do bias the data. Mr. [redacted] noted that he talked to the CX (Tom Georgian) who suggested you could bias one or two of the SUs, but you have to acknowledge that as part of your sampling design and it has to be less than 5% of the SUs. However, Mr. [redacted] asked what does biasing really mean because the idea here is that a random person is going to be walking randomly over this area and ingesting and being exposed to whatever is there, because that's what the risk assessment assumes. Therefore, it is a potential risk over that entire area whatever area you choose. So if it's random, it should be the same no matter what squares you choose to sample from and it should give you the same answers. That's the idea of the process. Mr. [redacted] added that theoretically we do not have any prior knowledge that's going to bias a receptor one way or the other. We do have some knowledge that would bias us, which is why we've carved out EC-57D and the ICP Shop Area, rather than use the whole site as our random area over which we're sampling. We did consider just doing the whole site but based on this data knew we couldn't because of those two areas, so this is what made the most sense to the team.

Mr. [redacted] noted that you have to remember that the data that was collected was hit or miss and the laboratory didn't use grinding methods. There is no confidence in the repeatability of the data, but it can be used to look at the distribution and based on this it appears to be randomly dispersed across the whole site. This again reinforces the concept that there is a nonpoint source issue that we feel supports having a DU of that size.

Ms. [redacted] added that some of the historical data used is from Parsons, and when Parsons did their RI even though a couple of these spots may show as exceedances, they determined there was no potential unacceptable risk to human health or the environment based on those results. You can look at an individual data point that might be an exceedance but when you look at the overall RI, it showed that there was not any potential unacceptable risk. Therefore, it's important to realize that some of those areas have already had a risk assessment. Mr. [redacted] added that this is a really good point and we should make sure that the up-front section of the work plan details what was done and that there was not a potential unacceptable risk in many of these areas previously investigated.

Ms. [redacted] reviewed Slide 23, which summarizes that we are going to: collect sufficient high-quality data to calculate our exposure concentrations for each DU for the HHRA; use the MDE standard of 10^{-5}; use the non-cancer hazard of 0.5; and perform a SLERA using the toxicity reference values. We will perform an FS if potential risks are considered unacceptable and identify the remediation alternatives. We will also be taking new background samples, from the same area we used during the prior investigation.

The team clarified that there are 3 separate RIs currently undergoing. There is the site-wide RI for arsenic and manganese (this project), there is the finalization of the RI that addressed all of the ECs at the Depot, which is in draft final form and MDE has reviewed, and then there will be a third RI for ECs -25 and -49 once the NTRCA is completed. Mr. [redacted] added that the Army is trying to close out sites where we have determined there is no issue. We can then set those aside, so the conversation is less complicated.

The meeting adjourned.

RE: Draft Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland – July 2018

Specific Comments:

1. Page 6, Lines 3-5
   The text states "Based on the sampling, sediment, surface water, surface soil, and subsurface soil samples had results for some metals that were above either the background values or 2008 Maryland Department of the Environment non-residential soil cleanup standard (Parsons, 2003)."
   While the Federal Facilities Installation Restoration Program (FFIRP) understands that this statement references a past document, it bears repeating that the document references the Maryland Cleanup Standards for non-residential soils. The Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" were specifically developed to support the Voluntary Cleanup Program and were to be used in lieu of a risk assessment. The guidance specifically states on Page 4 which State of Maryland programs the guidance was intended. The guidance was not intended for use at sites complying with the Comprehensive Environmental Response, Compensation and Liability Act.

   The "Cleanup Standards for Soil and Groundwater" are based on a snapshot in time calculation representing a cancer risk of $1x10^{-5}$. Consequently, when used for screening the "Cleanup Standards for Soil and Groundwater" are less stringent than the Risk Screening Level (RSL) tables prepared by the United States Environmental Protection Agency (USEPA) Region III, which are regularly updated and are based on a more conservative theoretical cancer risk of $1x10^{-6}$. Bearing this in mind, please make note to avoid reference and use of the Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" from future documents.

2. Page 25, Lines 1-21
   The text states "Decision rules for Decision Unit (DU) 2A/2B and DU 3A/3B sampling results are:
   - Compare surface soil sampling results to background surface soil sampling results. If surface soil results are greater than background, then compare the 95% upper confidence limit of the mean (UCL) result to USEPA RSLs for industrial soil. If the 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no further action (NFA) for arsenic and/or manganese.
   - If the 95% UCL result for surface soil is greater than or equal to the larger of the background surface soil results and USEPA RSLs for industrial soil, then conduct a Human Health Risk Assessment (HHRA) and Screening Level Environmental Risk Assessment (SLERA). Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.
   - Compare subsurface soil sampling results to background subsurface soil sampling results. If subsurface soil results are greater than background subsurface soil results,

then compare the subsurface soil 95% upper confidence limit of the mean (UCL) result of USEPA RSLs for industrial soil. If the subsurface soil 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no NFA for arsenic and/or manganese.

- If the 95% UCL result for subsurface soil is greater than or equal to the larger of background subsurface soil results and USEPA RSLs for industrial soil, then conduct an HHRA and SLERA. Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.
- If risks are identified in the HHRA or SLERA then conduct an FS."

The FFIRP does not concur with this approach. The "*Role of Background in the CERCLA Cleanup Program*" (OSWER 9285.6-07P) states on Page 6 that "the EPA's 1989 *Risk Assessment Guidance for Superfund* (RAGS) provides general guidance for selecting contaminants of potential concern (COPCs), and considering background concentrations. In RAGS, the EPA cautioned that eliminating COPCs based on background (either because concentrations are below background levels or attributable to background sources) could result in the loss of important risk information for those potentially exposed, even though cleanup may or may not eliminate a source of risks caused by background levels. In light of more recent guidance for risk-based screening and risk characterization, this policy recommends a baseline risk assessment approach that retains constituents that exceed risk-based screening concentrations. This approach involves addressing site-specific background issues at the end of the risk assessment, in the risk characterization. Specifically, the COPCs with high background concentrations should be discussed in the risk characterization, and if data are available, the contribution of background to site concentrations should be distinguished. COPCs that have both release-related and background-related sources should be included in the risk assessment. When concentrations of naturally occurring elements at a site exceed risk-based screening levels, that information should be discussed qualitatively in the risk characterization." In this case, arsenic and manganese concentrations should first be compared to USEPA RSLs, risk calculations should be made, and then a comparison of sample concentrations to site background concentrations should be made. Additionally, a future hypothetical resident should be included in the assessment to conservatively evaluate unlimited use/unrestricted exposure (UU/UE) land use. If the risk evaluation shows that sample concentrations exceed acceptable residential risk, then an FS is required in which "Land Use Controls" can be presented as an alternative, with the stipulation that any contamination exceeding risk to receptors under the industrial risk scenario would need to be addressed/remediated.

3. Page 25, Lines 22-31
   The text states "Decision Rules for DU 1A sampling results are:
   - Compare surface soil sampling results to background surface soil sampling results. If surface soil results are greater than background, then compare the 95% UCL result to USEPA RSLs for industrial soil. If the 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no further action (NFA) for arsenic and/or manganese.
   - If the 95% UCL result for surface soil is greater than or equal to the larger of the background surface soil results and USEPA RSLs for industrial soil, then conduct an

HHRA and SLERA. Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.

Please see Specific Response #2.

4. Page 25, Lines 32-36
   The text states "If unacceptable risks are identified in the HHRA and/or SLERA, then subsurface soil samples will be analyzed for arsenic and manganese (as identified in Step 5) for all surface SUs where results were greater than background surface soil results and USEPA RSLs for industrial soil. Additional sampling may be required to delineate the horizontal or vertical extent of arsenic and/or manganese concentrations in these areas."
   a) Please see Specific Response #2.
   b) The FFIRP does not concur that analysis of the subsurface soil samples for DU 1B should be contingent upon the results for DU 1A – there is always the possibility that surface samples will not be contaminated but subsurface samples would be. Random sampling of this large decision unit is already taking place, which already introduces a considerable degree of uncertainty. Please amend the work plan to include analysis of all samples collected for DU 1B, and carry this change throughout the document.

5. Page 26, Lines 1-2
   The text states "Site sample results will be compared to the larger of the background sampling results and the USEPA industrial soil RSLs."
   Please see Specific Comment #2.

6. Page 26, Lines 2-3
   The text states "Note that due to the variable sizes of the SUs, ERT will calculate the mean concentration over a DU using a weighted mean and weighted standard error."
   Please edit the text to further clarify this sentence.

7. Page 28, Table 7
   a) The measurement performance criterion for "precision" of the Incremental Sample (IS) Replicate percentage of relative standard deviation (%RSD) is listed as 35%. However, review of *Implementation of Incremental Sampling (IS) of Soil for the Military Munitions Response Program, Environmental and Munitions Center of Expertise Interim Guidance Document 09-02*, Page 10, 3rd Paragraph, 1st Sentence states "If the total %RSD (total error) between three to five field replicates from the same Sampling Unit is less than 30%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal." Please change the %RSD for IS replicates to 30% here and as it appears elsewhere in the document.
   b) In the document referenced in a), the text from Page 10, 5th Paragraph states "It is important to understand that the above discussion suggests general guidelines for acceptable %RSDs. They are merely suggestions to evaluate whether or not IS results can be assumed to be reasonably representative estimates of mean analyte concentrations in a Sampling Unit, and whether or not indications of non-normal distribution are evident in a IS data set. If IS gives an estimated mean concentration that is many times greater than or less than an action level or screening value, a much larger %RSD and high degree of

uncertainty may not affect data usability. But by the same reasoning, if an estimated mean concentration is close to an action level, a greater degree of precision may be desirable."
Please edit this document to provide a contingency which covers a situation where the mean concentrations of the SUs/DUs are close to the designated action level, including a definition of "close", as there is the possibility that even a %RSD of 30% may, for this particular site/these DUs, be too high to allow a good decision to be made regarding the path forward.

8. Page 37, Line 5
   The text states "A total of 36 soil samples will be collected from DU2."
   Is this to say that there are 36 soil sample increments in DU2? Are triplicate samples planned for surface and subsurface soil for DU2 and DU3? If not, please revise the sampling plan to include them.

9. Page 40, Lines 25-27
   The text states "After sample receipt by the laboratory, each sample will be air-dried and sieved through a #10 screen to remove particles that are greater than 2 millimeters and the samples will be ground using a teflon-coated ball mill."
   Will the larger material be discarded, or ground separately to be re-added to the sample? If not, please edit the text to include the basis for decision regarding the size of particle which will be excluded from further analysis.

10. Page 40, Lines 37-39
    The text states "If the total percentage of relative standard deviation (%RSD) (total error) replicates from the same SU is less than 30-35%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal (USACE, 2009)"
    a) Please see Specific Comment #7.
    b) Please add "of" after (total error) in this sentence.
    c) For SUs which have replicate samples collected, what method will be used to calculate the representative value for the SU? Will the two replicate results simply be averaged with the sample result, or will another method be used?

11. Page 48, Lines 8-10
    The text states "If the total %RSD (total error) replicates from the same SU is less than 30%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal (USACE, 2009).
    a) Please see Specific Comment #7.
    b) Please see Specific Comment #10b.

RE: Response to Comments on the Draft Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland – July 2018, dated November 9, 2018

Specific Comments:

1. Page 6, Section 2.1, Lines 3-5
   The text states "Based on the sampling, sediment, surface water, surface soil, and subsurface soil samples had results for some metals that were above either the background values or 2008 Maryland Department of the Environment non-residential soil cleanup standard (Parsons, 2003)."
   While the Federal Facilities Installation Restoration Program (FFIRP) understands that this statement references a past document, it bears repeating that the document references the Maryland Cleanup Standards for non-residential soils. The Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" were specifically developed to support the Voluntary Cleanup Program and were to be used in lieu of a risk assessment. The guidance specifically states on Page 4 which State of Maryland programs the guidance was intended. The guidance was not intended for use at sites complying with the Comprehensive Environmental Response, Compensation and Liability Act.
   The "Cleanup Standards for Soil and Groundwater" are based on a snapshot in time calculation representing a cancer risk of $1x10^{-5}$. Consequently, when used for screening the "Cleanup Standards for Soil and Groundwater" are less stringent than the Risk Screening Level (RSL) tables prepared by the United States Environmental Protection Agency (USEPA) Region III, which are regularly updated and are based on a more conservative theoretical cancer risk of $1x10^{-6}$. Bearing this in mind, please make note to avoid reference and use of the Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" from future documents.

   The response states "Comment noted."
   Response accepted.

2. Page 25, Lines 1-21
   The text states "Decision rules for Decision Unit (DU) 2A/2B and DU 3A/3B sampling results are:
   - Compare surface soil sampling results to background surface soil sampling results. If surface soil results are greater than background, then compare the 95% upper confidence limit of the mean (UCL) result to USEPA RSLs for industrial soil. If the 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no further action (NFA) for arsenic and/or manganese.
   - If the 95% UCL result for surface soil is greater than or equal to the larger of the background surface soil results and USEPA RSLs for industrial soil, then conduct a Human Health Risk Assessment (HHRA) and Screening Level Environmental Risk

Assessment (SLERA). Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.

- Compare subsurface soil sampling results to background subsurface soil sampling results. If subsurface soil results are greater than background subsurface soil results, then compare the subsurface soil 95% upper confidence limit of the mean (UCL) result of USEPA RSLs for industrial soil. If the subsurface soil 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no NFA for arsenic and/or manganese.
- If the 95% UCL result for subsurface soil is greater than or equal to the larger of background subsurface soil results and USEPA RSLs for industrial soil, then conduct an HHRA and SLERA. Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.
- If risks are identified in the HHRA or SLERA then conduct an FS."

The FFIRP does not concur with this approach. The "*Role of Background in the CERCLA Cleanup Program*" (OSWER 9285.6-07P) states on Page 6 that "the EPA's 1989 *Risk Assessment Guidance for Superfund* (RAGS) provides general guidance for selecting contaminants of potential concern (COPCs), and considering background concentrations. In RAGS, the EPA cautioned that eliminating COPCs based on background (either because concentrations are below background levels or attributable to background sources) could result in the loss of important risk information for those potentially exposed, even though cleanup may or may not eliminate a source of risks caused by background levels. In light of more recent guidance for risk-based screening and risk characterization, this policy recommends a baseline risk assessment approach that retains constituents that exceed risk-based screening concentrations. This approach involves addressing site-specific background issues at the end of the risk assessment, in the risk characterization. Specifically, the COPCs with high background concentrations should be discussed in the risk characterization, and if data are available, the contribution of background to site concentrations should be distinguished. COPCs that have both release-related and background-related sources should be included in the risk assessment. When concentrations of naturally occurring elements at a site exceed risk-based screening levels, that information should be discussed qualitatively in the risk characterization." In this case, arsenic and manganese concentrations should first be compared to USEPA RSLs, risk calculations should be made, and then a comparison of sample concentrations to site background concentrations should be made. Additionally, a future hypothetical resident should be included in the assessment to conservatively evaluate unlimited use/unrestricted exposure (UU/UE) land use. If the risk evaluation shows that sample concentrations exceed acceptable residential risk, then an FS is required in which "Land Use Controls" can be presented as an alternative, with the stipulation that any contamination exceeding risk to receptors under the industrial risk scenario would need to be addressed/remediated.

The response states "The current approach in which the background concentrations are compared to the site sampling data at the same time the site data are compared to industrial soil RSLs is consistent with DERP guidance and with the MDE approved work plans for the previously conducted remedial investigations. In the Draft Final Curtis Bay RI/FS, October, 2016, a detected constituent had to exceed both the industrial soil RSL and background

concentration to be carried through the risk assessment, and this approach was accepted by MDE. In order to maintain consistency between the two remedial investigations, and to avoid confusion, we believe the screening of detected site soil concentrations should be conducted as outlined in the UFP-QAPP.
Finally, the GSA, the landholding agency, on behalf of the United States of America (the owner), agree that future use of the property will be restricted to industrial use by the application of land use controls. The use of land use controls will be included as an alternative in the FS with other potential remedial options evaluated, as required by CERCLA, based on the outcome of the arsenic and manganese sampling."
The FFIRP does not concur with this response. Adherence to an incorrect procedure in order to maintain consistency with previous incorrect procedures is not justifiable. Please revise the approach to adhere to the previously-cited USEPA guidance.

3. Page 25, Lines 22-31
The text states "Decision Rules for DU 1A sampling results are:
    - Compare surface soil sampling results to background surface soil sampling results. If surface soil results are greater than background, then compare the 95% UCL result to USEPA RSLs for industrial soil. If the 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no further action (NFA) for arsenic and/or manganese.
    - If the 95% UCL result for surface soil is greater than or equal to the larger of the background surface soil results and USEPA RSLs for industrial soil, then conduct an HHRA and SLERA. Details outlining the procedures for the HHRA/SLERA are provided in Appendix D.

Please see Specific Response #2.

The response states "See Response to comment #2."
Please see the FFIRP response to response #2.

4. Page 25, Lines 32-36
The text states "If unacceptable risks are identified in the HHRA and/or SLERA, then subsurface soil samples will be analyzed for arsenic and manganese (as identified in Step 5) for all surface SUs where results were greater than background surface soil results and USEPA RSLs for industrial soil. Additional sampling may be required to delineate the horizontal or vertical extent of arsenic and/or manganese concentrations in these areas."
    a) Please see Specific Response #2.
    b) The FFIRP does not concur that analysis of the subsurface soil samples for DU 1B should be contingent upon the results for DU 1A – there is always the possibility that surface samples will not be contaminated but subsurface samples would be. Random sampling of this large decision unit is already taking place, which already introduces a considerable degree of uncertainty. Please amend the work plan to include analysis of all samples collected for DU 1B, and carry this change throughout the document.

The response states:
a) "See response to comment #2."
Please see the FFIRP response to response #2.

b) "Concur. All subsurface samples collected and analyzed, as requested, and the text will be revised accordingly. In addition, the CSM for DU1 (Figure 3b)will be updated to include a potentially complete pathway for subsurface soil."
Response accepted.

5. Page 26, Lines 1-2
The text states "Site sample results will be compared to the larger of the background sampling results and the USEPA industrial soil RSLs."
Please see Specific Comment #2.

The response states "See Response to comment #2."
Please see the FFIRP response to response #2.

6. Page 26, Lines 2-3
The text states "Note that due to the variable sizes of the SUs, ERT will calculate the mean concentration over a DU using a weighted mean and weighted standard error."
Please edit the text to further clarify this sentence.

The response states "Concur. Additional text will be added to WS#11 to describe the weighted mean and standard error. **See the separate attached Word document for the additional text.**
Response accepted.

7. Page 28, Table 7
   a) The measurement performance criterion for "precision" of the Incremental Sample (IS) Replicate percentage of relative standard deviation (%RSD) is listed as 35%. However, review of *Implementation of Incremental Sampling (IS) of Soil for the Military Munitions Response Program, Environmental and Munitions Center of Expertise Interim Guidance Document 09-02*, Page 10, 3rd Paragraph, 1st Sentence states "If the total %RSD (total error) between three to five field replicates from the same Sampling Unit is less than 30%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal." Please change the %RSD for IS replicates to 30% here and as it appears elsewhere in the document.
   b) In the document referenced in a), the text from Page 10, 5th Paragraph states "It is important to understand that the above discussion suggests general guidelines for acceptable %RSDs. They are merely suggestions to evaluate whether or not IS results can be assumed to be reasonably representative estimates of mean analyte concentrations in a Sampling Unit, and whether or not indications of non-normal distribution are evident in a IS data set. If IS gives an estimated mean concentration that is many times greater than or less than an action level or screening value, a much larger %RSD and high degree of uncertainty may not affect data usability. But by the same reasoning, if an estimated mean concentration is close to an action level, a greater degree of precision may be desirable."
   Please edit this document to provide a contingency which covers a situation where the mean concentrations of the SUs/DUs are close to the designated action level, including a

definition of "close", as there is the possibility that even a %RSD of 30% may, for this particular site/these DUs, be too high to allow a good decision to be made regarding the path forward.

The response states:

a) Concur. The document will be revised to use a DQO of 30% for the %RSD goal.

Response accepted.

b) The RSD percentage will be used to determine the sampling statistic (e.g., mean or 95% UCL [student's-t or Chebychev]) to use for comparison of site sampling data to screening levels. In further support of the sample approach rationale and to present a contingency plan for high % RSD, DLA has prepared an expanded discussion of % RSD and all procedures to be followed should the criteria not be achieved for the planned sampling (**see separate attached Word document**). This discussion will be added to the PARCSS discussion in Worksheet #37.

Response accepted.

8. Page 37, Line 5

The text states "A total of 36 soil samples will be collected from DU2."

Is this to say that there are 36 soil sample increments in DU2? Are triplicate samples planned for surface and subsurface soil for DU2 and DU3? If not, please revise the sampling plan to include them.

The response states "Clarification. For the ISM, each sample collected will consist of 30 increments. The number of SUs from which replicate (triplicate) samples will be collected is described in WS#20. The current sampling protocol includes surface and subsurface replicate (triplicate) sampling from one background, six DU1, two DU2, and one DU3 SUs. The sentence will be revised as, "*A total of 36 soil samples (plus QC replicates), each consisting of 30 increments, will be collected from the 18 SUs in DU 2.* "

Response accepted.

9. Page 40, Lines 25-27

The text states "After sample receipt by the laboratory, each sample will be air-dried and sieved through a #10 screen to remove particles that are greater than 2 millimeters and the samples will be ground using a teflon-coated ball mill."

Will the larger material be discarded, or ground separately to be re-added to the sample? If not, please edit the text to include the basis for decision regarding the size of particle which will be excluded from further analysis.

The response states "Concur. The following will be added to the text, '*The protocols associated with ISM sampling and analysis include the steps of airdrying and sieving. These steps, along with milling, help to control compositional and distributional heterogeneity leading to results that exhibit higher repeatability and lower variability. The sample material that is greater than 2 mm will be weighed and discarded in accordance with the ISM laboratory sample preparation guidance.* "

Response accepted.

10. Page 40, Lines 37-39

The text states "If the total percentage of relative standard deviation (%RSD) (total error) replicates from the same SU is less than 30-35%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal (USACE, 2009)"

a) Please see Specific Comment #7.
b) Please add "of" after (total error) in this sentence.
c) For SUs which have replicate samples collected, what method will be used to calculate the representative value for the SU? Will the two replicate results simply be averaged with the sample result, or will another method be used?

The response states:

a) "See response to comment #7."

Response accepted.

b) "Concur. The sentence will be revised as requested."

Response accepted.

c) "See the expanded response text included in the response to comment #7."

Response accepted.

11. Page 48, Lines 8-10

The text states "If the total %RSD (total error) replicates from the same SU is less than 30%, then the sampling design and execution are likely to be adequate, and the distribution of replicate results can be assumed to be approximately normal (USACE, 2009).

a) Please see Specific Comment #7.

Response accepted.

b) Please see Specific Comment #10b.

Response accepted.

The response states

a) "See response to comment #7."

Response accepted.

b) "Concur. The sentence will be revised as requested."

COMMENTS							
1	6	2.1	3-5	The text states "Based on the sampling, sediment, surface water, surface soil, and subsurface soil samples had results for some metals that were above either the background values or 2008 Maryland Department of the Environment non-residential soil cleanup standard (Parsons, 2003)." While the Federal Facilities Installation Restoration Program (FFIRP) understands that this statement references a past document, it bears repeating that the document references the Maryland Cleanup Standards for non-residential soils. The Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" were specifically developed to support the Voluntary Cleanup Program and were to be used in lieu of a risk assessment. The guidance specifically states on Page 4 which State of Maryland programs the guidance was intended. The guidance was not intended for use at sites complying with the Comprehensive Environmental Response, Compensation and Liability Act. The "Cleanup Standards for Soil and Groundwater" are based on a snapshot in time calculation representing a cancer risk of $1x10^{5}$ Consequently, when used for screening the "Cleanup Standards for Soil and Groundwater" are less stringent than the Risk Screening Level (RSL) tables prepared by the United States Environmental Protection Agency (USEPA) Region III, which are regularly updated and are based on a more conservative theoretical cancer risk of 1 $x10^{6}$ .Bearing this in mind, please make note to avoid reference and use of the Maryland Department of the Environment's "Cleanup Standards for Soil and Groundwater" from future documents.	Comment noted.	Response accepted.	
2	25	WS#11	22-31	The text states "Decision rules for Decision Unit (DU) 2A/2B and DU 3A/3B sampling results are: • Compare surface soil sampling results to background surface soil sampling results. If surface soil results are greater than background, then compare the 95% upper confidence limit of the mean (UCL) result to USEPA RSLs for industrial soil. If the 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no further action (NFA) for arsenic and/or manganese. • If the 95% UCL result for surface soil is greater than or equal to the larger of the background surface soil results and USEPA RSLs for industrial soil, then conduct a Human Health Risk Assessment (HHRA) and Screening Level Environmental Risk Assessment (SLERA). Details outlining the procedures for the HHRA/SLERA are provided in Appendix D. • Compare subsurface soil sampling results to background subsurface soil sampling results. If subsurface soil results are greater than background subsurface soil results, then compare the subsurface soil 95% upper confidence limit of the mean (UCL) result of USEPA RSLs for industrial soil. If the subsurface soil 95% UCL results are less than the USEPA RSLs for industrial soil, then recommend no NFA for arsenic and/or manganese. • If the 95% UCL resull for subsurface soil is greater than or equal to the larger of background subsurface soil results and USEPA RSLs for industrial soil, then conduct an HHRA and SLERA. Details outlining the procedures for the HHRA/SLERA are provided in Appendix D. • If risks are identified in the HHRA or SLERA then conduct an FS." The FFIRP does not concur with this approach. The "Role of Background in the CERCLA Cleanup Program" (OSWER 9285.6-07P) states on Page 6 that "the EPA's 1989 Risk Assessment Guidance for Superfund (RAGS) provides general guidance for selecting contaminants of potential concern (COPCs), and considering background concentrations. In RAGS, the EPA cautioned that eliminating COPCs based on background (either because concentrations are below background levels or attributable to background sources) could result in the loss of important risk information for those potentially exposed, even though cleanup may or may not eliminate a source of risks caused by background levels. In light of more recent guidance for risk-based screening and risk characterization, this policy recommends a baseline risk assessment approach that retains constituents that exceed risk-based screening concentrations. This approach involves addressing site-specific background issues at the end of the risk assessment, in the risk characterization. Specifically, the COPCs with high background concentrations should be discussed in the risk characterization, and if data are available, the contribution of background to site concentrations should be distinguished. COPCs that have both release-related and background-related sources should be included in the risk assessment. When concentrations of naturally occurring elements at a site exceed risk-based screening levels, that information should be discussed qualitatively in the risk characterization." In this case, arsenic and manganese concentrations should first be compared to USEPA RSLs, risk calculations should be made, and then a comparison of sample concentrations to site background concentrations should be made Additionally, a future hypothetical resident should be included in the assessment to conservatively evaluate unlimited use/unrestricted exposure (UU/UE) land use. If the risk evaluation shows that sample concentrations exceed acceptable residential risk, then an FS is required in which "Land Use Controls" can be presented as an alternative, with the stipulation that any contamination exceeding risk to receptors under the industrial risk scenario would need to be addressed/remediated.	The current approach in which the background concentrations are compared to the site sampling data at the same time the site data are compared to industrial soil RSLs is consistent with DERP guidance and with the MDE approved work plans for the previously conducted remedial investigations. In the Draft Final Curtis Bay RI/FS, October, 2016, a detected constituent had to exceed both the industrial soil RSL and background concentration to be carried through the risk assessment, and this approach was accepted by MDE. In order to maintain consistency between the two remedial investigations, and to avoid confusion, we believe the screening of detected site soil concentrations should be conducted as outlined in the UFP-QAPP. Memorandum for Record

Subject: Response to Email Message, sent 11 March 2019 from ERT on Sample Preparation on the Curtis Bay Depot RI/FS Project for Mn and As to change from processing of ISM Soil Samples from using a Teflon-Coated Ball Mill to a Puck Mill

Your request to use the puck mill for soil sample grinding in order to more efficiently process the large volume and quantities of soil samples consisting of a clay and sand mix is acceptable based on the method QC data provide for the 10 replicate method blanks and the LCS samples processed using the puck mill and analyzed for arsenic and manganese.

Based on an evaluation of the listed Measurement Performance Criteria (MPC) for the two metals in QAPP Worksheet #12, the method blank result for manganese needs to be < 1/10 the regulatory limit (or < 1/10th the amount measure in any sample [whichever is greater] per the DoD QSM). Between the writing of the Draft QAPP and then the Final version of the QAPP, two additional regulatory criteria were added to Worksheet #15: the USEPA Residential and the USEPA BTAG, with the BTAG regulatory value for Mn being the lowest at 330 mg/kg. A tenth of that value is 33 mg/kg, therefore any Method Blank analysis needs to be < 33 mg/kg for Mn. The Method Blank results presented for Mn range from 2.8 to 4.5 mg/kg which is a factor of 7x below 1/10th the Regulatory Limit. Also 9 of the 10 LCS samples spiked for Mn were within acceptable percent recovery limits with the one falling outside the QC limit at 80% which was slightly below the 85% Lower Limit.

For the Arsenic analysis, using the puck mill with a limit of a one-minute grind cycle is acceptable to prevent the puck mill from getting too hot. If another grinding cycle will be done, several minutes should be allowed for the puck mill to cool down. The puck mill should not contain arsenic as part of its elemental makeup, so that shouldn't be a contributing factor in the method blank analysis. The lowest regulatory action level listed for Arsenic in QAPP Worksheet #15 is 0.68 mg/kg, the EPA Residential value. Based on the reported method blank results, the values for arsenic are below the EPA Residential Action Limit or are non-detect.

Subject: Re: [Non-DoD Source] Curtis Bay Depot Arsenic and Manganese RI Analytical Method (UNCLASSIFIED)

[redacted]

About half of the samples have been analyzed. I talked with the lab yesterday and the lowest reported concentration thus far was 3.3 mg/kg. If we have reported results for arsenic that are less than the LOQ for the 6010 method, the lab suggested that those samples could be analyzed using method 7010. 7010 has and LOQ 0f 0.16 mg/kg which is less than the USEPA residential soil RSL of 0.68 mg/kg.
Thanks,
[redacted]

Subject: Re: [Non-DoD Source] Curtis Bay Depot Arsenic and Manganese RI Analytical Method

[redacted]

The project laboratory is not DoD certified for method 6020. Truthfully, the use of 6020 in the UFP-QAPP was my mistake when writing the UFP-QAPP and the inconsistency (between the UFP-QAPP and laboratory SOPs) was not caught during any of the review processes.

I am truly sorry for the inconvenience this has caused.

Subject: [Non-DoD Source] Curtis Bay Depot Arsenic and Manganese RI Analytical Method

[redacted]

I received a call from the lab this morning concerning the analytical method listed in the UFP-QAPP and the analytical method that CT performs. We have method 6020A listed in the UFP-QAPP, but the laboratory does not perform this method. CT performs metals analysis via method 6010C. Note that the laboratory SOPs in the UFP-QAPP are for method 6010C.

All samples will be analyzed via method 6010C. The LOQs, LODs, and DLs are:
Arsenic - LOQ = 0.80 mg/kg, LOD = 0.40, DL = 0.13
Manganese - LOQ = 0.15, LOD = 0.075, DL = 0.025

The only screening level that won't be achieved by the LOQ is the USEPA RSL for residential soil for arsenic (0.68 mg/kg). However, the anticipated typical concentration (ATC) of arsenic in eastern Maryland soils (3.6 mg/kg) is also greater than the residential soil RSL for arsenic (State of Maryland Department of the Environment Cleanup Standards for Soil and Groundwater Interim Final Guidance [update No. 3], October, 2018) and the previously derived background concentrations for surface (9.09 mg/kg) and subsurface (9.26 mg/kg) soil (Draft Final MMRP and IRP RI Report, ERT, October 2016). Therefore, it is unlikely that the analytical results for arsenic in the samples collected from the Curtis Bay Depot for the arsenic and manganese RI will be less than the ATC and the LOQ limit for arsenic is not likely to introduce any additional uncertainties into the analytical results reported for arsenic.

thank you,

Response to MDE Comments on the Draft Final Remedial Investigation Report for the Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil (November 2019)

General	Comment	Response	Backcheck Comment	Final Resolution
1	The United States Environmental Protection Agency (USEPA) does not accept upfront background comparison and elimination of contaminants of potential concern (COPCs) during the first step of the risk assessment process; the Federal Facilities Installation Restoration Program (FFIRP) concurs with the USEPA' s position regarding this matter. Therefore, elimination of COPCs during Step 1 is not acceptable. All contaminants that exceed USEPA Regional Screening levels should be carried forward to Step 2 of the risk assessment process. Please revise relevant text and tables pertaining to the human health risk assessment (HHRA) and screening level ecological risk assessment accordingly.	This comment does not apply to the Depot-wide arsenic and manganese RI. This RI did not use upfront background comparisons to eliminate COCs or COPECs. The background data were not introduced into the HHRA until Section 7.1.4.4, after the evaluation of site data for risk, and the SLERA did not use the background data to eliminate any COPECs.	On page 44, Lines 14-19, the text states "The maximum concentrations were used as screening values and compared to both the RSL screening values and background concentrations. As the maximum concentrations of arsenic (As) and manganese (Mn) at each of the three DUs exceeded both the residential RSLs and background concentrations, both metals were identified as COPCs (USEPA, 2018). As such, both arsenic and manganese were carried through the quantitative baseline HHRA for each of the three DUs (Attachments A, B, and C)." The above-stated text states that sample concentrations are being compared to site background concentrations in the first step - and only when background concentrations are exceeded, are COPC designations given and subsequently carried through the baseline HHRA process. If this is not the case, please revise the text to clarify this point.	Concur. ERT will carry forward all concentrations of As and Mn that exceed USEPA Regional Screening levels (RSLs) to Step 2 of the risk assessment process. ERT will revise the text and tables accordingly.
2	The FFIRP does not accept the assumption of 63 days per year for site workers and construction workers. Please use the standard 250 days per year when revising HHRAs (USEPA, 1993, Superfund's Standard Default Exposure Factors For The Central Tendency And Reasonable Maximum Exposure). Additionally, the FFIRP does not accept the assumption of 8 hours per day/350 days per year for residential adult and child. The appropriate assumption for residential receptors is 24 hours per day (USEPA, 1993, Superfund's Standard Default Exposure Factors For The Central Tendency And Reasonable Maximum Exposure). Please update the HHRAs accordingly.	The HHRA was conducted in accordance with the MDE approved UFP-QAPP. Appendix D of the MDE approved Final UFP-QAPP clearly outlined the exposure assumptions used to evaluate the risks.	Response not accepted. The original comment stands.	Concur. ERT will use the standard 250 days per year. Additionally, ERT will use 24 hours per day/350 days per year for residential adult and child. EA will update the EC HHRAs accordingly.
3	Please remove from this document references to degraded ecological habitat as justification for no further action despite the existence of risk to ecological receptors, as it constitutes inappropriate circular logic. Unless an installation is managed to actively prevent habitation by ecological receptors (which is not the case at the installation being investigated in this document), resident ecological receptors should be shielded from inappropriate risk due to contamination of site media as a result of historical site activities.	The conclusions of the SLERA are not based on the condition of the ecological habitat. Rather, they are based on the concentrations of manganese and arsenic as measured for this RI. The weight of evidence conclusion for DU 3 (likely ecological impacts due to manganese) do include the observation that vegetation is less vigorous than in other areas of the Depot. This is an appropriate use of the "quality of habitat".	Accepted.	
4	The results from the risk analysis for human and ecological receptors from this investigation should be combined with that from the basewide investigation as appropriate to ensure that cumulative risk to human and ecological receptors from multiple contaminants of concern is accurately assessed.	The protocol and procedures for conducting the HHRA and SLERA were outlined in the MDE approved UFP-QAPP and did not include combining the sampling results from the IRP/MMRP EC RI.	The original comment stands. For sites in the Basewide RI which deferred examination of As and Mn, especially those which lie within DU-1 (DU-2 is specific to As and DU-3, to Mn) the DU-1 risks from As and Mn should be added to relevant ECs in Basewide RI.	Per the partnering meeting held on May 19, 2020, MDE agreed to not require risks from As and Mn to be added to any relevant ECs in the Basewide RI.

Response to MDE Comments on the Draft Final Remedial Investigation Report for the Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil (November 2019)

Specific	Comment	Response	Backcheck Comment	
1	Page 18, Section 3.2.3.4, Lines 13-14 The text states "ERT conducted background surface and subsurface soil sampling in the U. S. Army Reserve Property." Per the historical information provided on Page ES-1, "Approximately 37 acres were reassigned to the U.S. Army Reserve in 1958 and 1966." The background samples were collected in an area which was originally part of the Curtis Bay installation. Please provide more information about the locations in which background samples were collected to ensure that the locations were not impacted by historical site activities or significant anthropomorphic (*sic*) activities.	To clarify, the following text has been included in Section 3.2.3.4. *"The background area was selected based on a review of historical records for the Former Curtis Bay Depot. During the use of the background area for the Depot, the area selected for the background sampling contained administrative and housing for base personnel and was not used for other mission support activities. Therefore, this area is not likely to be impacted by the ore pile storage and related activities associated with the potential arsenic and manganese impacts to site soil.* " Note that, the background sampling area (DU 4), sampling locations (with minor modifications due to field conditions), and sampling procedures were provided in the MDE approved UFP-QAPP (sampling units depicted on Figure 8 of the UFP-QAPP). In addition, the sampling results for arsenic and manganese are generally within the range of the background metals values presented in Attachment 1 of Appendix 2 of the State of Maryland Department of the Environment Cleanup Standards for Soil and Groundwater, October 2018. This would indicate that the area selected for background sampling is appropriate for this investigation. The goal of the background sampling was to determine arsenic and manganese concentrations that are naturally occurring and/or anthropogenic causes unrelated to the site. Given the location of the Former Curtis Bay Depot in an industrial developed area, this location likely is the least impacted available and representative of the current background conditions for the Depot.	Accepted.	
2	Page 22, Section 4.1, Lines 7-9 The text states "Of the 47 calculated Relative Standard Deviation s (RSDs) for field replicate samples, 49% (23) were within project Data Quality Objectives (DQOs), 33% (14) were greater than 30% but less than 50 %, 15% (7) were greater than 50 % but less than 100%, and 0.6% (3) were greater than 100%." Please correct the 33% to 30% and the 0.6% to 6.0% here and where this text appears on Page 23, Section 4.2, Lines 6-7. Less than 50% of the RSDs met DQOs (less than 30% error), and 21% of the RSDs exceeded 50% error. How much of an issue does this present when it comes to making decisions based on this data? Please add text to address the increased level of uncertainty associated with this high incidence of DQO exceedances.	Agree. The typographical errors have been corrected. Although typically shown as a DQO, statistically, the RSD is a data descriptor that provides an indication of the likely underlying distribution of the sample population. Large RSD likely indicate that the underlying data population is not normally distributed. The evaluation of the upper confidence limit of the mean (UCL) used the non-parametric Chebyshev equation. As indicated in the report, use of the non-parametric equation for evaluation of the UCL reduces the false negative decision errors. To clarify this in the report, the last two sentences of this paragraph have been revised as, *"The presence of RSDs greater than project DQOs may increase the level of uncertainty with respect to the decisions made based on these data. To address the increased level of uncertainty and to minimize the false negative decision errors that might be associated with high RSDs, ERT used the non-parametric (Chebyshev) equation for calculating the 95% upper confidence limit of the mean (95% UCL) for arsenic and/or manganese for all replicate samples for which the RSD was greater than project DQOs for comparison to the project screening levels* ."	Accepted.	
3	Page 59, Section 7.2.1.2, Lines 15-16 The text states "The Depot has been filled, drained, graded, and otherwise altered to the point that there are no undisturbed areas remaining. " During site visits, significant portions of EC-21 (which comprises approximately 10 acres) were observed to be heavily forested. While most of the Depot has been considerably altered to facilitate historical site activities, the above statement should be edited to more accurately describe the range of site conditions present at the Depot.	Agree. For clarity, the sentence has been revised as, "*The Depot has been filled, drained, graded and otherwise altered to the point that there are no natural areas remaining, although there are areas of the Depot now covered by successional fields and successional hardwood forests* ."	Accepted.	
4	Page 65, Section 7.2.1.3, Lines 8-11 The text states "The assessment endpoints provide a transition between broad management, or policy goals, and the specific measures used in the assessment, supported by numerically-defined decision rules (Error! Reference source not found.)." Please provide the correct source reference for this material, if a citation is necessary; otherwise, please remove the parenthetical error message from the text.	Agree. The table number reference has been added.	Accepted.	
5	Page 71, Section 7.2.2.4, Line 19 The text states "quality of habitat for receptors". Please see General Comment #3 and remove this bullet from the text.	While this bullet can be removed, the quality of habitat was used to argue that manganese impacts were evident at DU 3.	Accepted.	

Response to MDE Comments on the Draft Final Remedial Investigation Report for the Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil (November 2019)

Specific	Comment	Response	Backcheck Comment	
6	Page 73, Section 7.2.2.4, Lines 14-19 The text states "For this assessment, it was assumed that the potential toxic effects of the contaminants of potential ecological concern (COPECs) (i.e., arsenic and manganese) were non-additive. This assumption may result in the underestimation of risk as concurrent exposure to several contaminants could have synergistic toxic effects. The risk characterization of metals does not include additive effects as there is no evidence of clearly additive effects in ecological systems." Please provide additional information including source citations to support the assumption that potential toxic effects of COPECs are non-additive. Additionally, see General Comment #4 - how is the decision-making team taking into account the cumulative risk potential to human and ecological receptors from the Curtis Bay Depot site as a whole?	SLERA analyses assume worst-case conditions with respect to such factors as chemical concentrations and area use factors. SLERA analyses do not examine possible additive or synergistic effects from different COPECs as the factors contributing to these effects are many, varied, and complex. With respect to the influence of arsenic and manganese on mammals and birds, research indicates that arsenic affects the peripheral nervous system, while manganese affects the central nervous system. Both may affect organs such as the liver and kidney, but, at least for manganese, these effects are associated with acute concentration levels. In USEPA's guidance document titled "Framework for Metals Risk Assessment" (March 2007), the agency states that, with the exception of a few hyperaccumulator species, the risk assessor "can reasonably assume that most plant species do not bioconcentrate metals" and that arsenic and other heavy metals "are not taken up by plants in measurable quantities" and that "the small amount that is taken up is mostly confined to root tissues (Chaney et al., 2000; McGrath, 1995; Chaney and Ryan, 1994; Xu and Thornton, 1985)." In this guidance document, USEPA also states that many plants are sensitive to otherwise-essential metals, including manganese, and that "the risk assessor should be aware that plants frequently die before achieving high metal concentration levels that pose a threat to animals via food chain transfer (with the exception of the hyperaccumulator species, as noted above)." Furthermore, the agency states that, at present, the possibilities of modeling mixtures of metals remain theoretical and that "the accurate prediction of joint toxicity of metal mixtures to terrestrial organisms remains a significant challenge." See response to General Comment #4..	Accepted re: cumulative effects for ecological receptors. See the reply to the response to General Comment #4.	Per the partnering meeting held on May 19, 2020, MDE agreed to not require risks from As and Mn to be added to any relevant ECs in the Basewide RI.
7	Appendix C, "Depot-Wide Remedial Investigation/Feasibility Study for Arsenic and Manganese in Soil- MDE Comments and USACE Responses", Page 1, Comment 2, Backcheck Response/Resolution The text states "Concur, DLA will adhere to USEPA guidance, with the understanding that this concurrence will be in effect for all work going forward and will not affect previous or ongoing Remedial Investigations." The FFIRP does not accept this statement applying to ongoing Remedial Investigations. Please see General Comment #1.	The RTCs and backcheck comments provided in Appendix C are on the UFP-QAPP and were provided to MDE prior to receiving the MDE letter dated 1 March 2019 accepting the Final UFP-QAPP. Also, note that the HHRA and SLERA conducted for this RI did not use background data to eliminate COCs or COPECs prior to performance of the risk assessments. See response to General Comment #1.	Accepted. Please see response to General Comment #1.	Concur. ERT will carry forward all concentrations of As and Mn that exceed USEPA Regional Screening levels (RSLs) to Step 2 of the risk assessment process. ERT will revise the text and tables accordingly.

1.0 Introduction

ERT, Inc. (ERT) performed a statistical analysis of the site and background surface and subsurface soil samples collected for the Former Curtis Bay Ordnance Depot Arsenic (As) and Manganese (Mn) Remedial Investigation (RI). Background and site soil samples were collected using the Incremental Sampling Methodology (ISM). Section 2 documents the development of the background threshold values (BTVs), used for screening site soil sampling results. Section 3 documents the relative standard deviation (RSD) and relative percent difference (RPD) calculations for the site and background soil sampling results and 95 percent (%) Upper Confidence Limit calculations for the site soil sampling results. Details of the sampling and analysis can be found in the RI Report.

2.0 Analysis of Background Data

ERT conducted background soil sampling to determine the concentrations of As and Mn due to naturally occurring and anthropogenic (non-Department of Defense [DoD]) sources. As and Mn were detected in every background soil sample collected (uncensored data). Note that ERT used the arithmetic mean of the results for the replicates collected for sampling units (SUs) DU4A-SU07 and DU4B-S07 for the background data statistical analysis. ERT performed the statistical analysis using ProUCL version 5.1 software and technical guidance (USEPA, 2015). This section presents the results of the statistical analysis for the development of the BTVs. ProUCL output and other summary tables are provided in the tables at the end of this report.

ERT used the following steps in the statistical analysis of metals in background soil:

1. Evaluate outliers for each analyte grouped by horizon (surface soil and subsurface soil),
2. Evaluate goodness of fit (GOF) for each analyte grouped by horizon,
3. Evaluate the Analysis of Variance (ANOVA) to compare surface soil to subsurface soil,
4. Combine surface and subsurface sampling results based on ANOVA results,
5. Evaluate outliers in combined data sets,
6. Evaluate GOF in combined data sets,
7. Remove outliers from grouped (step 2) and combined (step5) if GOF shows data are non-parametric (no discernable distribution) and the outlier likely represents a data point that is not representative of background.
8. Calculate the grouped or combined data set BTVs using the revised data set.

Each of the steps is discussed below.

2.1 Outliers by Horizon (Surface/Subsurface Soil)

ERT analyzed the background As and Mn data to determine potential outliers in the background data set using the "Outlier Tests, Full (w/o NDs)" tool in ProUCL. During the initial outlier evaluation, data were grouped by horizon; each data set had seven measurements for each metal. The results of the outlier tests showed a potential upper tail outlier (7.2 mg/kg in DU4B-SU01) at all significance levels for arsenic in subsurface soil. The ProUCL output of the outlier evaluations is provided in Table D.1-1.

2.2 Goodness of Fit by Horizon (Surface/Subsurface Soil)

After analyzing the outliers in the background arsenic and manganese data, ERT ran the "Goodness-of-Fit Tests, Full (w/o NDs), G.O.F. Statistics" to evaluate the potential data distribution(s) for each analyte and each horizon. All data appeared normal, gamma, and/or

lognormal at the 0.05 significance level. The ProUCL output of the GOF tests is provided in Table D.1-2.

2.3 Analysis of Variance (ANOVA)

In accordance with the Uniform Federal Policy – Quality Assurance Project Plan (UFP-QAPP) (ERT, 2019), ERT performed a statistical comparison (ANOVA at p=0.05) of the background surface soil ISM samples to the background subsurface soil ISM samples to determine if the if the background surface soil and background subsurface soil are likely from the same population. Using the GOF results from step 2 to evaluate the distributions of each metal, ERT performed "Oneway ANOVA, Classical".

A p-value less than or equal to 0.05 (or alternative selected level) suggests that there are differences in the mean characteristics of the surface and subsurface soil for arsenic and/or manganese. A p-value greater than 0.05 suggests that the mean characteristics are comparable. The p-value for the surface and subsurface soil ANOVA for arsenic was 0.651 and for manganese was 0.679. The results of the ANOVA indicated that the mean/median characteristics of the surface and subsurface data are comparable for arsenic and manganese. Therefore, the data for surface and subsurface soil for will be combined for further analysis (step 4). The ProUCL output of the ANOVA is provided in Table D.1-3 (Classical One-Way ANOVA).

2.4 Outliers in Combined Data Sets

Based on the results of the ANOVA, ERT performed an examination of the combined arsenic and the combined manganese data set to evaluate potential outliers within the combined data sets. The results of the outlier tests showed a potential upper tail outlier at the 0.10 and 0.05 significance levels, but not at the 0.01 significance level for arsenic in the combined surface/subsurface soil. No outliers were identified in the combined surface and subsurface soil manganese data set.The ProUCL output of the outlier evaluations is provided in Table D.1-4.

2.5 GOF in Combined Data Sets

Based on the results of the ANOVA, ERT performed an analysis of the GOF for the combined arsenic and combined manganese data sets. The arsenic combined data set appeared either gamma or lognormal at the 0.05 significance level. The manganese combined data set appeared either normal, gamma, or lognormal at the 0.05 significance level. The ProUCL output of the GOF evaluations is provided in Table D.1-5.

2.6 Removal of Outliers

Although the combined arsenic results exhibited a potential outlier, there is no reason to suspect that the potential arsenic outlier is inconsistent with the background population for arsenic in eastern Maryland background soil as the value of the potential arsenic outlier (7.2 mg/kg) is equal to the USGS average concentration cited in Appendix 2 of the State of Maryland Department of the Environment Cleanup Standards for Soil and Groundwater (MDE, 2018). Therefore, the potential outlier was not removed from the combined arsenic data set.

2.7 Background Threshold Values

To determine the background soil concentrations for comparison to site soil sampling results, ERT calculated the BTVs using the ProUCL, version 5.1, software. ERT used the combined surface

and subsurface soil data sets from steps 1 through 7, as described above, for the BTV data set. The ProUCL BTV output is provided in Table D.1-6.

While the combined surface and subsurface soil arsenic data exhibit either lognormal distribution or a gamma distribution, because the combined arsenic data contain a potential outlier, ERT selected the BTV for arsenic using the gamma distribution statistic "95% HW Approx. Gamma Upper Threshold Limit (UTL) with 95% Coverage". Use of a BTV from the lognormal distribution in a dataset that contains a potential outlier would likely overestimate the BTV. The BTV for arsenic in surface and subsurface soil is 7.8 mg/kg

The combined surface and subsurface soil manganese data exhibited either normal, gamma, or lognormal distributions. ERT selected the BTV for manganese using the normal distribution statistic "95% UTL with 95% Coverage". The BTV for manganese in surface and subsurface soil is 460.5 mg/kg.

It should be noted that other data distributions and/or alternate upper limit statistics could have been selected for this analysis. However, ERT selected each of the BTVs (using UTL statistics) so that the background population for each metal is likely to be covered by the selected BTV.

3.0 Analysis of Relative Standard Deviation and 95% Upper Confidence Limit of the Mean

ERT calculated the ISM replicate sample RSDs as part of the evaluation of data representativeness. Representativeness is the extent to which measurements represent the true environmental condition or population at the time of sample collection.

ERT also calculated the 95% Upper Confidence Limit of the Mean (UCL) for ISM replicate samples. In accordance with the UFP-QAPP (ERT, 2019), the method for calculating the UCL (Student's t or Chebyshev) is based on the calculated RSD.

This section presents the results of the RSD, RPD, and UCL calculations.

3.1 RSD Calculations and Results

ERT calculated the RSD for the field and laboratory replicate ISM soil samples collected at the Former Curtis Bay Ordnance Depot in accordance with the Interstate Technology Regulatory Council (ITRC) Incremental Sampling Methodology Technical and Regulatory Guidance (ITRC, 2012). The RSD reflects the total sum of field and laboratory error in the data (i.e., field sampling error, lab processing/subsampling error, and lab analysis error). The standard deviation is a well-known measure of the variation from the mean among a group of samples. The lower the standard deviation (i.e., the closer the replicate data are to the mean) the more precise the site data are as an estimate of average contaminant concentration in the SU under investigation. When the mean concentration of a contaminant reported for a set of ISM replicate samples is close to the PSLs, a lower standard deviation for the replicates provides stronger evidence that the true SU mean is less than the action level. A low standard deviation for soil sample data is achieved by minimizing error in sample collection, processing, and analysis to the extent feasible. The RSD represents the ratio of the standard deviation of the replicate set over the mean of the replicate set, expressed as a percentage:

$$RSD\ (\%) = \frac{replicate\ standard\ deviation}{replicate\ mean} * 100\%$$

3.1.1 Field Replicate RSDs

The project goal for RSDs was 30 percent (%). An RSD less than 30% is considered to reflect good precision for estimates of the average (ITRC 2012). Good precision implies that the sampling method used, including the SU size, number, spacing, and size/shape of increments collected were adequate to capture and reflect small-scale heterogeneity of contaminant distribution within the SU and that error in the laboratory processing and analysis methods was low.

In additional to field replicate (triplicate) samples, ERT collected field split samples to validate the use of coring for samples collected using direct push technology (DPT) where the step probe could not be used to collect the sample. ERT used coring, as outlined in the ITRC guidance (ITRC, 2012) to reduce the mass of the samples collected and submitted to the laboratory.

A summary of the RSD calculations for each DU, each analysis, and each interval is presented in Table D.1-7, below.

Table D.1-7. Summary of Field Replicate and Field Split RSD Results

Decision Unit	Interval	Field Replicates	Field Splits	RSD ≤ 30%	30% < RSD ≤ 50%	50% < RSD ≤ 100%	RSD > 100%
DU 1	Surface	6	1	9	5	1	0
	Subsurface	6	1	9	4	3	0
DU 2	Surface	2	0	2	2	0	0
	Subsurface	2	0	1	2	1	1
DU 3	Surface	1	0	0	0	1	1
	Subsurface	1	0	0	0	1	1
DU 4 (Background)	Surface	1	0	1	1	0	0
	Subsurface	1	0	2	0	0	0

Of the 47 calculate RSDs, 49% (23) were within project DQOs, 33% (14) were greater than 30% but less than 50%, 15% (7) were greater than 50% but less than 100%, and 0.6% (3) were greater than 100%. Note that the calculated RSDs for the field split sample were within the project DQO indicating that the coring method used to reduce the sample mass sent to the laboratory did not adversely affect the sampling results. The calculated RSDs for site replicate and field split samples are provided in Tables D.1-8 through D.1-15.

Based on the evaluation of the field replicate samples and field split sample RSDs, it does not appear that there is a systematic field error associated with the field sampling protocol. The sample support (mass of each ISM sample) provided to the laboratory exceeded the recommended 1-2 kgs for all samples collected. Therefore, it is likely that the RSDs outside of QC limits indicate that arsenic and/or manganese concentrations in the site soil are not normally distributed over the SU areas. If additional soil sampling at the Depot is conducted, reducing the size of the sampling units, either by increasing the number of replicates, reducing the dimensions to less than 0.5 acres or limiting the sampling interval to less than 12 inches, or a combination of these, to capture and reflect small-scale heterogeneity of contaminant distribution is recommended.

3.1.2 Laboratory Replicate RSDs

The project goal for laboratory replicate RSDs was 15%. The laboratory replicate RSDs are used to evaluate contribution of the laboratory processing and analysis methods to the (statistical) errors associated with the sampling results. A summary of the RSD calculations for the laboratory replicate samples is provided in Table D.1-16, below.

Table D.1-16. Summary of Laboratory Replicate RSD Results

Decision Unit	Interval	Replicate Samples	RSD ≤ 15%	RSD > 15%
DU 1	Surface	10	14	5
	Subsurface	8	10	5
DU 2	Surface	1	2	0
	Subsurface	1	2	0
DU 3	Surface	1	2	0
	Subsurface	1	1	1
DU 4 (Background)	Surface	1	1	1
	Subsurface	1	2	0

Of the 46 calculated laboratory replicate RSDs, 74% (34) were within the project DQOs and 26% were greater than the project DQOs. The calculated laboratory replicate RSDs are provided in Tables D.1-17 through D.1-24.

Given that the majority of the laboratory replicate RSDs were within the project DQOs, it does not appear that there were any systematic errors in the sample processing or analysis. It is likely that field errors (i.e., distribution of contaminants in soil) contributed to the laboratory replicate RSDs that were greater than the project DQOs.

3.2 95% Upper Confidence Limit of the Mean

To compare the site sampling results to the PSLs, ERT calculated the 95% UCL using the ITRC "ISM Calculator for 1-sided Upper Confidence Limit (UCL) for the Mean" for each replicate sample data set. Each replicate data set was entered into the ISM calculator with alpha = 0.05 and the calculated UCL was recorded in Tables D.1-8 through D.1-15. Details on calculation of the UCLs are provided in the UFP-QAPP (ERT, 2019).

ERT selected the student's t or Chebyshev UCL for all replicates based on the calculated RSD for each of the replicate samples. The student's t UCL was used for comparison to criteria and in the risk assessments for all replicate results where the RSD was less than or equal to 30% and the Chebyshev UCL was used for comparison to criteria and in the risk assessments for all replicate results where the RSD greater than 30%.

81												
82	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
83	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
84	and consists of observations collected from clean unimpacted locations.											
85	The use of USL tends to provide a balance between false positives and false negatives provided the data											
86	represents a background data set and when many onsite observations need to be compared with the BTV.

Legend:
1. The 95% UCL is calculated using the Chebyshev method for sample replicate relative standard deviations (RSD) greater than 30% and the Student's t method, otherwise.
Blank cells indicate that the sample was not analyzed by the method.
mg/kg - milligrams per kilogram
FT - field triplicate
FSI - field split incremental sample
QC - quality control
RSD - relative standard deviation
UCL - upper confidence limit of the mean

Bold RSD values indicate that the RSD exceeds the QC limit.
Highlighted cells indicate that the RSD is greater than 100%

Student's t method UCL formula

$$95\%\ UCL = mean + t_{(1-\alpha)(r-1)} * \frac{SD}{\sqrt{r}}$$

Chebyshev method UCL formula

$$95\%\ UCL = mean + \left(\sqrt{\frac{1}{\alpha} - 1} * \frac{SD}{\sqrt{r}}\right)$$

Where:
mean - arithmetic mean of the replicate samples
SD - standard deviation
r - number of replicate samples
α - acceptable level of potential decision error (e.g., 0.05 or 5% for a 95% UCL)
t - (1-αth) quantile of the Student's-t distribution with (r-1) degrees of freedom

$$95\%\ UCL = mean + \left(\sqrt{\frac{1}{\alpha} - 1} * \frac{SD}{\sqrt{r}}\right)$$

Where:

mean - arithmetic mean of the replicate samples

SD - standard deviation

r - number of replicate samples

α - acceptable level of potential decision error (e.g., 0.05 or 5% for a 95% UCL)

t - (1-αth) quantile of the Student's-t distribution with (r-1) degrees of freedom

Legend:

1. The 95% UCL is calculated using the Chebyshev method for sample replicate relative standard deviations (RSD) greater than 30% and the Student's t method, otherwise.

Blank cells indicate that the sample was not analyzed by the method.
mg/kg - milligrams per kilogram
FT - field triplicate
FSI - field split incremental sample
QC - quality control
RSD - relative standard deviation
UCL - upper confidence limit of the mean

Bold RSD values indicate that the RSD exceeds the QC limit.
Highlighted cells indicate that the RSD is greater than 100%

Student's t method UCL formula

$$95\%\ UCL = mean + t_{(1-\alpha)(r-1)} * \frac{SD}{\sqrt{r}}$$

Chebyshev method UCL formula

$$95\%\ UCL = mean + \left(\sqrt{\frac{1}{\alpha} - 1} * \frac{SD}{\sqrt{r}}\right)$$

Where:
mean - arithmetic mean of the replicate samples
SD - standard deviation
r - number of replicate samples
α - acceptable level of potential decision error (e.g., 0.05 or 5% for a 95% UCL)
t - (1-αth) quantile of the Student's-t distribution with (r-1) degrees of freedom

DATA VALIDATION REPORT

DEPOT-WIDE REMEDIAL INVESTIGATION / FEASIBILITY STUDY
FOR ARSENIC AND MANGANESE IN SOIL AT THE
FORMER CURTIS BAY ORDNANCE DEPOT
ANNE ARUNDEL COUNTY, MARYLAND

CT LABORATORIES, LLC

SAMPLE DELIVERY GROUP [redacted] / FOLDERS [redacted]

JUNE 26, 2019

Prepared for:

Earth Resources Technology, Inc.
[redacted]
Laurel, MD 20707
[redacted]

Prepared by:

HSW Engineering, Inc.
[redacted]
Tampa, Florida 33624
[redacted]

HSW Project [redacted]

1.0 Introduction

This Data Validation Report (DVR) is a summary of the review and validation of environmental analytical data for sample delivery group (SDG) [redacted]). The analytical work was performed by CT Laboratories, LLC, Baraboo, Wisconsin (CT). The analytical data were validated in accordance with specifications given in the document titled *Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-wide Remedial Investigation / Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland (February 2019)* (UFP QAPP). This document was prepared by ERT, Inc., Laurel, Maryland, for the U.S. Army Corps of Engineers (USACE) under Contract No. [redacted] Delivery Order [redacted]

Validation qualifiers were those defined by in the UFP QAPP and are summarized as follows. Definitions of commonly-used terms and acronyms used in this DVR but not expressly defined can be found in the document cited above or in the laboratory data package.

Data Validation Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample limit of detection.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported limit of detection is approximate and may be inaccurate or imprecise.
R	The data are unusable. Sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

The analytical deliverables conformed to Level IV (or Stage 4) reporting as defined by the U.S. Environmental Protection Agency (USEPA) in the document titled *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA 540-R-08-005). Validation was limited to Level III (Stage 2b) deliverables as defined in this guidance document.

A combination of automated and manual means were used to validate the data, with Stage 2a electronic data deliverables (SEDD 2a) processed through ADR.net automated data review software against criteria established in an electronic quality assurance project plan (eQAPP) prepared by ERT with input from CT. This automated review was supplemented by a manual review of non-ADR.net-processable information (e.g., case narratives, instrument calibration data, etc.).

2.0 General Information

The following 34 soil samples, collected by the incremental sampling methodology (ISM), were submitted for laboratory analysis of arsenic and manganese. The laboratory prepared the samples in accordance with their standard operating procedure (SOP) GEO-13, which incorporates USACE guidance for preparation of ISM samples. The prepared samples were analyzed for the two target metals by EPA Method 6010C.

2.1 Sample Delivery and Condition Upon Receipt

The chain-of-custody (COC) forms were reviewed and deemed acceptable. The samples were received by the laboratory in good condition, in sufficient quantities, and at acceptable temperatures. No issues upon receipt had been noted by the laboratory. Copies of USACE and USEPA authorization to use a puck

mill for grinding the samples (rather than a ball mill, as had been specified in the UFP QAPP) were included in the Level IV analytical data deliverable.

Qualification: None required.

2.2 Case Narrative and Completeness

The laboratory data package was reviewed for completeness, with no discrepancies noted. The narrative was thorough in identifying several issues, all of which were taken into consideration as part of the validation process.

Qualification: None required, based on the case narrative or data package completeness.

2.3 Holding Times

The samples were prepared and analyzed for target analytes (metals only) within required holding times.

Qualification: None required.

2.4 Field Quality Control (QC) Samples

2.4.1 Field-Generated Blanks

No field-generated blanks were required, as noted in the UFP QAPP.

Qualification: None required.

2.4.2 Field Replicates

Field replicates (triplicates) were collected at six ISM sampling locations and identified with suffixes of R1, R2, and R3. The UPF QAPP gives a precision goal of 30% RSD for field triplicates. This limit was exceeded for arsenic for three of the six triplicates, including locations DU1B-SU11 (41.53% RSD), DU1A-SU09 (46.48% RSD), and DU1B-SU51 (41.39% RSD), and for manganese at locations DU1B-SU09 (90.1% RSD), DU1B-SU11 (52.12%), DU1A-SU51 (40.8%), and DU1A-SU09 (38.55%) (refer to the Field Triplicate RSD Report included as an attachment to this DVR).

Qualification: No qualifications were made based on %RSD exceedances alone. However, the variability in triplicate results will be taken into consideration by the project team in estimating the level of confidence in the representativeness of discrete samples and in utilizing the data for decision-making purposes.

3.0 Analytical Data

3.1 Metals (EPA Method 6010C)

The soil samples underwent sieving and grinding, followed by acid digestion in either of two preparation batches.

Method Blanks

A low level of manganese was detected in one of the two method blanks, and low levels of both arsenic and manganese were detected in the second of the two method blanks. In all instances, the concentrations of these metals detected in the soil samples exceeded the artifact threshold values of

five times the concentrations detected in the blanks, precluding the need for qualification of sample data.

Qualification: None required.

Laboratory Control Samples (LCSs)
The recoveries of arsenic and manganese reported for the two LCSs were within acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)
Additional volumes of samples DU1A-SU07, DU1A-SU58, and DU1B-SU58 were used for MS/MSD analyses. While the MS/MSD recoveries reported for arsenic and manganese for samples DU1A-SU58 and DU1B-SU58 met validation acceptance criteria for analytical accuracy (recoveries of within 82-111% for arsenic and 84-114% for manganese) and analytical precision (relative percent difference, or %RPD, of within 20%), the laboratory reported slightly low MS/MSD recoveries of arsenic in the spike analyses of sample DU1A-SU07 (both 80%) and a failure to recovery manganese in these spike samples (both 0%).

Qualification: The detections of arsenic and manganese reported for parent sample DU1A-SU07 (11.1 mg/Kg and 671 mg/Kg, respectively) were classified as less than fully quantitative, based on MS/MSD recoveries, and were coded with a J- validation qualifiers.

Serial Dilutions / Post-Digestion Spikes (SDs/PDSs)
The laboratory analyzed five-fold SDs and PDSs of samples DU1A-SU07, DU1A-SU58, and DU1B-SU58. The results of these quality control analyses reported for samples DU1A-SU58 and DU1B-SU58 met project and validation acceptance criteria, with no qualification of the results for arsenic and manganese required. In the SD analysis of sample DU1A-SU07, the recovery of arsenic was deemed invalid due to the relatively low concentration of the analyte in the parent sample, while the PDS recovery of arsenic (66%) was less than the acceptance range (80-120%). The result for manganese reported for the SD analysis of sample DU1A-SU07 was deemed to have failed (i.e., 12% difference, or %D, relative to the parent sample), while the PDS result for manganese was not meaningful as the PDS spike concentration was less than one-fourth the concentration of manganese in the parent sample. As noted in the previous subsection, the laboratory reported low recoveries of arsenic and a failure to recover manganese in the MS/MSD analyses of sample DU1A-SU07.

Qualification: The combined SD and PDS data served as additional reasons for the application of the J- qualifier to the result for arsenic for sample DU1A-SU07. As the result for manganese for the five-fold dilution of this sample was greater than the result for the parent sample, a J+ validation qualifier was applied to the result. These qualifiers were entered into the "Professional Judgment" field of the SEDD to keep them distinct from qualifiers applied due to MS/MSD recoveries. The final validation qualifier for arsenic for sample DU1A-SU07 was J-, while the final validation qualifier for manganese for this sample was J (i.e., J- from MS/MSD results and J+ from SD result).

Laboratory Duplicates and Triplicates
The laboratory analyzed samples DU1A-SU58 and DU1B-SU58 in duplicate and analyzed samples DU1A-SU07, DU1A-SU11R1, and DU1B-SU51R2 in triplicate for arsenic and manganese. Duplicate results were evaluated by the %RPD, and triplicate results were evaluated by the percent relative standard deviation (%RSD). The laboratory's information management system (LIMS) is not capable of calculating and reporting %RSDs for triplicates (i.e., only %RPDs were reported, in both the Level IV data package and

SEDD 2a); therefore, %RSDs for triplicate results were manually calculated by the validator and compared with the limit of 15% RSD given in the eQAPP. The evaluation of field duplicate and triplicate results is summarized as follows.

Analyte	ERT Sample ID	Sample Type	Result	Lab Qualifier	RSD (%)	RPD (%)	LOD	LOQ
ARSENIC	DU1A-SU07		11.1	Y,M			0.41	0.82

Qualification: The ADR.net software applied qualifiers to samples analyzed in duplicate or triplicate when the %RPDs exceeded the limit given in the UFP QAPP (20%). In one instance (arsenic reported for sample DU1A-SU11R1), the qualifier applied by the software was removed by the validator, as the %RSD was acceptable (i.e., 14.5%, or within 15%). In two other instances (arsenic and manganese reported for sample DU1A-SU07), the ADR.net software had applied J qualifiers based on %RPDs. As the %RSDs for these two results exceeded 15%, the J qualifiers were retained but ascribed to laboratory triplicate results, rather than laboratory duplicate results, not being within control limits. (Note that qualifiers of J- previously applied were automatically revised by the ADR.net software to J qualifiers when the %RSD or %RPD exceeded the limit; i.e., direction of bias was no longer clearly indicated).

Initial Calibrations (ICALs)
The two multi-point ICALs of arsenic and manganese, performed daily (3/19/2019 and 3/20/2019) in association with the analysis of the project samples, met requirements for linearity, with all correlation coefficient (r^2) values approximating 1.0.

Qualification: None required.

Initial Calibration Verifications and Lower Limit of Quantitation Checks (ICVs / LLQCs)
ICVs and LLQCs were analyzed following each ICAL. All ICV and LLQC recoveries were within acceptance limits (90-110% and 80-120%, respectively).

Qualification: None required.

Continuing Calibration Verifications (CCVs)
All mid-level and high-level CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial and Continuing Calibration Blanks (ICBs/CCBs)
Neither of the two target metals was detected in either of the two ICBs or in any of the CCBs bracketing the sample analyses.

Qualification: None required.

Interference Check Samples (ICS-A and -AB)
The absolute values reported for arsenic and manganese in the analysis of the two ICS-A solutions were less than the magnitude of the limits of detection (LODs). The recoveries of arsenic and manganese in the analysis of the two ICS-AB solutions were within the acceptance range of 80-120%.

Qualification: None required.

Internal Standards
A representative subset of the data for internal standard (yttrium) were reviewed from the raw data. Instrument readings were consistent from one sample to the next, and the %RSDs of the multiple instrument readings were acceptable (less than 5% in these spot-checks of the raw data).

Qualification: None required.

Analyte Quantitation
No dilutions were required, and no issues associated with the analytical findings, other than as previously described, were noted.

Qualification: None required.

4.0 Final Validation Qualifiers

Of 68 discrete results reported for the 34 project samples, only three results were qualified as a result of the validation (Attachment A). No results were rejected or recommended for exclusion; therefore, analytical completeness in terms of usable data is 100%.

HSW Project No: [redacted]

1.0 Introduction

This Data Validation Report (DVR) is a summary of the review and validation of environmental analytical data for sample delivery group (SDG) [redacted] The analytical work was performed by CT Laboratories, LLC, Baraboo, Wisconsin (CT). The analytical data were validated in accordance with specifications given in the document titled *Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-wide Remedial Investigation / Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland (February 2019)* (UFP QAPP). This document was prepared by ERT, Inc., Laurel, Maryland, for the U.S. Army Corps of Engineers (USACE) under Contract No. [redacted] Delivery Order [redacted]

Validation qualifiers were those defined by in the UFP QAPP and are summarized as follows. Definitions of commonly-used terms and acronyms used in this DVR but not expressly defined can be found in the document cited above or in the laboratory data package.

Data Validation Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample limit of detection.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported limit of detection is approximate and may be inaccurate or imprecise.
R	The data are unusable. Sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

The analytical deliverables conformed to Level IV (or Stage 4) reporting as defined by the U.S. Environmental Protection Agency (USEPA) in the document titled *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA 540-R-08-005). Validation was limited to Level III (Stage 2b) deliverables as defined in this guidance document.

A combination of automated and manual means were used to validate the data, with Stage 2a electronic data deliverables (SEDD 2a) processed through ADR.net automated data review software against criteria established in an electronic quality assurance project plan (eQAPP) prepared by ERT with input from CT. This automated review was supplemented by a manual review of non-ADR.net-processable information (e.g., case narratives, instrument calibration data, etc.).

2.0 General Information

The following 40 soil samples, collected by the incremental sampling methodology (ISM), were submitted for laboratory analysis of arsenic and manganese. The laboratory prepared the samples in accordance with their standard operating procedure (SOP) GEO-13, which incorporates USACE guidance for preparation of ISM samples. The prepared samples were analyzed for the two target metals by EPA Method 6010C.

2.1 Sample Delivery and Condition Upon Receipt

The chain-of-custody (COC) forms were reviewed and deemed acceptable. The samples were received by the laboratory in good condition, in sufficient quantities, and at acceptable temperatures. Minor issues regarding the correct identification of two samples were effectively resolved at the time of sample log-in. Copies of USACE and USEPA authorization to use a puck mill for grinding the samples (rather than a ball mill, as had been specified in the UFP QAPP) were included in the Level IV analytical data deliverable.

Qualification: None required.

2.2 Case Narrative and Completeness

The laboratory data package was reviewed for completeness, with no discrepancies discerned. The narrative was thorough in identifying several issues, all of which were taken into consideration as part of the validation process.

Qualification: None required, based on the case narrative or data package completeness.

2.3 Holding Times

The samples were prepared and analyzed for target analytes (metals only) within required holding times.

Qualification: None required.

2.4 Field Quality Control (QC) Samples

2.4.1 Field-Generated Blanks

No field-generated blanks were required, as noted in the UFP QAPP.

Qualification: None required.

2.4.2 Field Replicates

No field replicates were collected from any of the sampling locations addressed by this DVR.

Qualification: None required.

3.0 Analytical Data

3.1 Metals (EPA Method 6010C)

The soil samples underwent sieving and grinding, followed by acid digestion in any one of three preparation batches.

Method Blanks

Low levels of arsenic and manganese were detected in each of the three method blanks. In all instances, the concentrations of these metals detected in the soil samples exceeded the artifact threshold values of five times the concentrations detected in the blanks, precluding the need for qualification of sample data.

Qualification: None required.

Laboratory Control Samples (LCSs)
The recoveries of arsenic and manganese reported for each of the three LCSs were within acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)
Additional volumes of samples DU1A-SU05, DU3A-SU01, DU3B-SU01, DU1A-SU56, and DU1B-SU56 were used for MS/MSD analyses. The MS/MSD recoveries reported for arsenic and manganese for samples DU3A-SU01, DU3B-SU01, and DU1A-SU56 and for arsenic for sample DU1B-SU56 met validation acceptance criteria; i.e., all recoveries either were within the required acceptance limits (82-111% for arsenic and 84-114% for manganese) or, in the case of manganese, were not meaningful due to the high concentration of the analyte in the parent sample, relative to the spike concentration (i.e., greater than four times as much). The laboratory reported low recoveries of arsenic and manganese of less than the lower acceptance limits for the MS and/or MSD analyses of sample DU1A-SU05 and of manganese in both the MS and MSD analyses of sample DU1B-SU56. In all instances, the MS/MSD relative percent differences (%RPDs) were within acceptance limits.

Qualification: The following sample results (all detections) were classified as less than fully quantitative, based on the MS and/or MSD recoveries.

CT Sample ID	ERT Sample ID	Analyte	Result	Qualifier
253258	DU1A-SU05	ARSENIC	21.2	J-
		MANGANESE	826	J-
254965	DU1B-SU56	MANGANESE	349	J-

Serial Dilutions / Post-Digestion Spikes (SDs/PDSs)
The laboratory analyzed five-fold SDs of samples DU1A-SU05, DU3A-SU01, DU3B-SU01, DU1A-SU56, and DU1B-SU56. In all instances, the results for arsenic were invalid due to the relatively low concentrations of the analyte in the parent samples (i.e., less than 50 times the limit of quantitation , or LOQ, prior to the five-fold dilution), while the results for manganese were valid but deemed to have failed, with percent differences (%Ds) of greater than 10%. The laboratory performed PDS analyses of these samples, with low or failed recoveries reported for manganese for samples DU1A-SU05 (72%), DU1B-SU56 (0%), DU3A-SU01 (65%), and DU3B-SU01 (0%) and a low recovery reported for arsenic for sample DU3A-SU01 (67%). The acceptance range is 80-120%.

Qualification: The combined SD and PDS data served as additional reasons for the application of J- qualifiers to the results for manganese for samples DU1A-SU05 and DU1B-SU56 (previously qualified due to low MS/MSD recoveries) and for the application of J- qualifiers to the detections of manganese reported for samples DU3A-SU01 and DU3B-SU01 and for arsenic reported for sample DU3A-SU01. These qualifiers were entered into the "Professional Judgment" field of the SEDD to keep them distinct from qualifiers applied due to MS/MSD recoveries.

Laboratory Duplicates and Triplicates
The laboratory analyzed samples DU1A-SU56 and DU1B-SU56 in duplicate and analyzed samples DU1A-SU05, DU3A-SU01, DU3B-SU01, DU1B-SU47, and DU1B-SU42 in triplicate for arsenic and manganese. Duplicate results were evaluated by the %RPD, and triplicate results were evaluated by the percent relative standard deviation (%RSD). The laboratory's information management system (LIMS) is not capable of calculating and reporting %RSDs for triplicates (i.e., only %RPDs were reported, in both the

Level IV data package and SEDD 2a); therefore, %RSDs for triplicate results were manually calculated by the validator and compared with the limit of 15% RSD given in the eQAPP.

Qualification: The ADR.net software applied qualifiers to samples analyzed in duplicate or triplicate when the %RPDs exceeded the limit given in the UFP QAPP (20%). In one instance (arsenic reported for sample DU3A-SU01), the qualifier applied by the software was removed by the validator, as the %RSD was acceptable (i.e., within 15%). In another instance, the ADR.net software correctly applied a validation qualifier of J based on %RPD (to the detection of manganese reported for sample DU1B-SU56); this qualifier was allowed to remain. In two other instances (manganese reported for sample DU3B-SU01 and arsenic reported for sample DU1B-SU42), the ADR.net software had applied J qualifiers based on %RPDs. As the %RSDs for these two results exceeded 15%, the J qualifiers were retained but ascribed to laboratory triplicate results, rather than laboratory duplicate results, not being within control limits. (Note that qualifiers of J- previously applied were automatically revised by the ADR.net software to J qualifiers when the %RSD or %RPD exceeded the limit; i.e., direction of bias was no longer clearly indicated).

Initial Calibrations (ICALs)

The six multi-point ICALs of arsenic and manganese, performed daily, met requirements for linearity, with all correlation coefficient (r^2) values approximating 1.0.

Qualification: None required.

Initial Calibration Verifications and Lower Limit of Quantitation Checks (ICVs / LLQCs)

ICVs and LLQCs were analyzed following each ICAL. All ICV and LLQC recoveries were within acceptance limits (90-110% and 80-120%, respectively).

Qualification: None required.

Continuing Calibration Verifications (CCVs)

All mid-level and high-level CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial and Continuing Calibration Blanks (ICBs/CCBs)

No metals were detected in any of the ICBs. Low-level detections of arsenic and manganese were detected in some CCBs; however, the on-instrument detections of arsenic and manganese in all 40 soil samples exceeded the artifact threshold values of five times the concentrations detected in the blanks.

Qualification: None required.

Interference Check Samples (ICS-A and -AB)

The absolute values reported for arsenic and manganese in all ICS-A solutions were less than the magnitude of the limits of detection (LODs). The recoveries of arsenic and manganese in the analysis of the ICS-AB solutions were within the acceptance range of 80-120%.

Qualification: None required.

Internal Standards

A representative subset of the data for internal standard (yttrium) were reviewed from the raw data. Instrument readings were consistent from one sample to the next, and the %RSDs of the multiple instrument readings were acceptable (less than 5% in these spot-checks of the raw data).

Qualification: None required.

Analyte Quantitation

Eight samples required dilutions by factors of ten and one sample (DU3B-SU01) required dilution by a factor of 100, to allow accurate quantitation of manganese. No other dilutions were required. No issues associated with the analytical findings, other than as previously described, were noted.

Qualification: None required.

4.0 Final Validation Qualifiers

Of 80 discrete results reported for the 40 project samples, seven results (three for arsenic and four for manganese) were qualified as a result of the validation (Attachment A). No results were rejected or recommended for exclusion; therefore, analytical completeness in terms of usable data is 100%.

History of Manual Changes to Automated Data Review Qualifiers

Changed by: Cindy Lee Westergard

Analyte	Method	Analysis Type	Result	Unit	Reason Code	Original Value	New Value	Edit Time	
Field Sample ID: DU1A-SU05									
MANGANESE	6010C	INITIAL	826	mg/kg	Professional Judgment		J-	6/4/2019	15:05
Reason for change:	SD results deemed to have failed, and PDS recovery was less than 80%.								
Field Sample ID: DU1B-SU42									
ARSENIC	6010C	INITIAL	11.3	mg/kg	Laboratory Duplicate Precision	J		6/4/2019	15:14
Reason for change:	Laboratory duplicates evaluation, based on %RPD, superseded by laboratory triplicates evaluation, based on %RSD.								
ARSENIC	6010C	INITIAL	11.3	mg/kg	Laboratory Triplicate Precision		J	6/4/2019	15:17
Reason for change:	The %RSD generated for the laboratory triplicate analyses of this sample (77.8%) exceeded the limit given in the eQAPP (15%).								
Field Sample ID: DU1B-SU56									
MANGANESE	6010C	DILUTION-01	349	mg/kg	Professional Judgment		J-	6/4/2019	15:06
Reason for change:	SD results deemed to have failed, and PDS recovery was less than 80%.								
Field Sample ID: DU3A-SU01									
ARSENIC	6010C	INITIAL	8.2	mg/kg	Professional Judgment		J-	6/4/2019	15:08
Reason for change:	SD result was deemed to have failed, and PDS recovery was less than 80%.								
ARSENIC	6010C	INITIAL	8.2	mg/kg	Laboratory Duplicate Precision	J		6/4/2019	15:09
Reason for change:	Although the RPD for one of the laboratory duplicate analyses exceeded 20%, the %RSD for the three triplicates was acceptable (<15%).								
MANGANESE	6010C	DILUTION-01	4870	mg/kg	Matrix Spike Lower Estimation	J-		6/4/2019	15:02
Reason for change:	The recovery data were not meaningful as the spike concentration was less than one-fourth the concentration of the analyte in the parent sample.								

Analyte	Method	Analysis Type	Result	Unit	Reason Code	Original Value	New Value	Edit Time	
Field Sample ID: DU3A-SU01									
MANGANESE	6010C	DILUTION-01	4870	mg/kg	Matrix Spike Upper Estimation	J+		6/4/2019	15:02
Reason for change:	The recovery data were not meaningful as the spike concentration was less than one-fourth the concentration of the analyte in the parent sample.								
MANGANESE	6010C	DILUTION-01	4870	mg/kg	Professional Judgment		J-	6/4/2019	15:07
Reason for change:	SD results were deemed to have failed, and PDS recovery was less than 80%.								
Field Sample ID: DU3B-SU01									
MANGANESE	6010C	DILUTION-01	7430	mg/kg	Matrix Spike Lower Estimation	J-		6/4/2019	15:02
Reason for change:	The recovery data were not meaningful as the spike concentration was less than one-fourth the concentration of the analyte in the parent sample.								
MANGANESE	6010C	DILUTION-01	7430	mg/kg	Professional Judgment		J-	6/4/2019	15:08
Reason for change:	SD result was deemed to have failed, and PDS recovery was less than 80%.								
MANGANESE	6010C	DILUTION-01	7430	mg/kg	Laboratory Duplicate Precision	J		6/4/2019	15:12
Reason for change:	Laboratory duplicates evaluation (%RPD) superseded by laboratory triplicates evaluation (%RSD).								
MANGANESE	6010C	DILUTION-01	7430	mg/kg	Laboratory Triplicate Precision		J	6/4/2019	15:13
Reason for change:	The %RSD results from the laboratory triplicate analyses (35.5%) exceeded the limit of 15% given in the eQAPP.								

DATA VALIDATION REPORT

**DEPOT-WIDE REMEDIAL INVESTIGATION / FEASIBILITY STUDY
FOR ARSENIC AND MANGANESE IN SOIL AT THE
FORMER CURTIS BAY ORDNANCE DEPOT
ANNE ARUNDEL COUNTY, MARYLAND**

CT LABORATORIES, LLC

SAMPLE DELIVERY GROUP [redacted] / FOLDERS [redacted]

HSW Project No: [redacted]

1.0 Introduction

This Data Validation Report (DVR) is a summary of the review and validation of environmental analytical data for sample delivery group (SDG) 143765 (folders [redacted] The analytical work was performed by CT Laboratories, LLC, Baraboo, Wisconsin (CT). The analytical data were validated in accordance with specifications given in the document titled *Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-wide Remedial Investigation / Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland (February 2019)* (UFP QAPP). This document was prepared by ERT, Inc., Laurel, Maryland, for the U.S. Army Corps of Engineers (USACE) under Contract No. [redacted] Delivery Order [redacted]

Validation qualifiers were those defined by in the UFP QAPP and are summarized as follows. Definitions of commonly-used terms and acronyms used in this DVR but not expressly defined can be found in the document cited above or in the laboratory data package.

Data Validation Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample limit of detection.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported limit of detection is approximate and may be inaccurate or imprecise.
R	The data are unusable. Sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

The analytical deliverables conformed to Level IV (or Stage 4) reporting as defined by the U.S. Environmental Protection Agency (USEPA) in the document titled *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA 540-R-08-005). Validation was limited to Level III (Stage 2b) deliverables as defined in this guidance document.

A combination of automated and manual means was used to validate the data, with Stage 2a electronic data deliverables (SEDD 2a) processed through ADR.net automated data review software against criteria established in an electronic quality assurance project plan (eQAPP) prepared by ERT with input from CT. This automated review was supplemented by a manual review of non-ADR.net-processable information (e.g., case narratives, instrument calibration data, etc.).

2.0 General Information

The following 86 soil samples, collected by the incremental sampling methodology (ISM), were submitted for laboratory analysis of arsenic and manganese. The laboratory prepared the samples in accordance with their standard operating procedure (SOP) GEO-13, which incorporates USACE guidance for preparation of ISM samples. The prepared samples were analyzed for the two target metals by EPA Method 6010C (inductively-coupled plasma-atomic emission spectrometry [ICP-AES]). Samples for which results for arsenic were less than the laboratory's limit of quantitation (LOQ) by EPA Method 6010C were reanalyzed for arsenic by EPA Method 7010 (graphic furnace atomic absorption [GFAA] spectrophotometry), which has greater sensitivity and lower LOQ than does Method 6010C.

2.1 Sample Delivery and Condition Upon Receipt

The chain-of-custody (COC) forms were reviewed and deemed acceptable. The samples were received by the laboratory in good condition, in sufficient quantities, and at acceptable temperatures. Copies of USACE and USEPA authorization to use a puck mill for grinding the samples (rather than a ball mill, as had been specified in the UFP QAPP) were included in the Level IV analytical data deliverable.

Qualification: None required.

2.2 Case Narrative and Completeness

The laboratory data package was reviewed for completeness, with no discrepancies noted. The narrative was thorough in identifying several issues, all of which were taken into consideration as part of the validation process.

Qualification: None required, based on the case narrative or data package completeness.

2.3 Holding Times

The samples were prepared and analyzed for target analytes (metals only) within required holding times.

Qualification: None required.

2.4 Field Quality Control (QC) Samples

2.4.1 Field-Generated Blanks

No field-generated blanks were required, as noted in the UFP QAPP.

Qualification: None required.

2.4.2 Field Replicates

Field replicates (triplicates) were collected at eight ISM sampling locations and from two core samples that had been collected via direct-push technology (DPT). Triplicate samples collected from the two DPT core samples were identified with suffixes of S1, S2, and S3. All other triplicate samples were identified with suffixes of R1, R2, and R3. The results for these ten sets of triplicate samples, along with the percent relative standard deviation (%RSD) for each, are summarized as follows. The UPF QAPP gives a precision goal of 30% RSD for field triplicates. This limit was exceeded in several instances.

Method	Analyte	ERT Sample ID	Result	Lab Qualifier	RSD (%)	Limit of Detection (LOD)	Limit of Quantitation (LOQ)
6010C	ARSENIC	DU1A-SU30S1	3.3			0.42	0.85

Qualification: No qualifications were made based on %RSD exceedances alone. However, the variability in triplicate results will be taken into consideration by the project team in estimating the level of confidence in the representativeness of discrete samples and utilizing the data for decision-making purposes.

3.0 Analytical Data

The soil samples underwent sieving and grinding, followed by acid digestion, in any one of seven preparation batches. One of these batches was for reanalysis of 12 samples for arsenic by GFAA (EPA Method 7010); all others were for arsenic and manganese by ICP-AES (EPA Method 6010C).

3.1 Metals (EPA Method 6010C)

Method Blanks

Low levels of arsenic were detected in four of the six method blanks analyzed by ICP-AES, and low levels of manganese were detected in all six of these method blanks. In all instances, the concentrations of arsenic and manganese reported by ICP-AES exceeded the artifact threshold values of five times the concentrations detected in the corresponding method blank such that no qualification of the data was necessary.

Qualification: None required.

Laboratory Control Samples (LCSs)

The recoveries of arsenic and manganese reported for the six LCSs analyzed by ICP-AES were within project acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)

Additional volumes of samples DU2B-SU02R2, DU2A-SU10, and DU2B-SU10 were used for MS/MSD analyses, while additional volumes of sample DU1B-SU15 were used for MS analysis only. The MS/MSD recoveries reported for arsenic and manganese for samples DU2B-SU02R2 and DU2B-SU10 were within

the required acceptance limits (82-111% for arsenic and 84-114% for manganese). The MS recovery of manganese reported for sample DU1B-SU15 and MS/MSD recoveries of arsenic reported for sample DU2A-SU10 also were within acceptance limits. The laboratory reported a low MS recovery of arsenic for sample DU1B-SU15 (62%) and low MS/MSD recoveries of manganese for sample DU2A-SU10 (40%/80%). In all instances, the MS/MSD relative percent differences (%RPDs) were within acceptance limits.

Qualification: The following parent sample results were classified as less than fully quantitative, based on the MS and/or MSD recoveries.

CT Sample ID	ERT Sample ID	Analyte	Result	Qualifier
256798	DU1B-SU15	ARSENIC	8.0	J-
258269	DU2A-SU10	MANGANESE	1,910	J-

Serial Dilutions (SDs)

The laboratory analyzed five-fold SDs of sample DU2A-SU10 for manganese and samples DU1B-SU15 and DU1A-SU44R1 for arsenic. The results for manganese were valid (i.e., the concentration of manganese in the parent sample was greater than 50 times the limit of quantitation, or LOQ) and yielded a percent difference (%D) of 12%, which slightly exceeds the limit (10%). The results for arsenic were deemed invalid (not meaningful) due to the relatively low concentrations of arsenic in the parent samples prior to dilution (i.e., less than 50 x LOQ).

Qualification: The detection of manganese reported for sample DU2A-SU10 (1,910 mg/Kg), previously qualified with a J- validation qualifier due to the low MS/MSD recoveries, was re-assigned a validation qualifier of J based on the SD %D (a J qualifier rather than a J- qualifier was used as the result for the five-fold dilution was greater than the result reported for the undiluted parent sample). This qualifier was entered into the "Professional Judgment" field of the SEDD to distinguish it from the qualifier applied due to the MS/MSD recoveries.

Post-Digestion Spikes (PDSs)

The laboratory performed PDS analyses of samples DI2B-SU02R2 (manganese), DU1B-SU15 (arsenic), DU2B-SU10 (arsenic and manganese), and DU2A-SU10 (arsenic and manganese). A low recovery was reported for arsenic for the PDS of sample DU1B-SU15 (39% vs. 80-120%). In all other instances, the recoveries were within the acceptance range.

Qualification: The detection of arsenic reported for sample DU1B-SU15 (8.0 mg/Kg) previously was qualified with a J- validation qualifier due to a low MS recovery. The low PDS recovery serves as an additional reason for the application of the J- qualifier.

Laboratory Duplicates and Triplicates

The laboratory performed triplicate analyses of samples DU1A-SU38, DU2B-SU02R2, DU1B-SU15, DU1A-SU30S1, DU2A-SU04, and DU1A-SU18 and duplicate analyses of sample DU2A-SU10. The laboratory's information management system (LIMS) is not capable of calculating and reporting %RSDs for triplicates (i.e., only %RPDs were reported in the Level IV data package); therefore, %RSDs for triplicate results

were manually calculated by the validator and compared with the limit of 15% RSD given in the eQAPP. As summarized below, all %RSDs or %RPDs were within acceptance limits.

Analyte	ERT Sample ID	Sample Type	Result	Lab Qualifier	RSD (%)	RPD (%)	LOD	LOQ

Qualification: None required.

Initial Calibrations (ICALs)
The multi-point ICALs of arsenic and manganese, performed daily, met requirements for linearity, with all correlation coefficient (r^2) values approximating 1.0.

Qualification: None required.

Initial Calibration Verifications and Lower Limit of Quantitation Checks (ICVs / LLQCs)
ICVs and LLQCs were analyzed following each ICAL. All ICV and LLQC recoveries were within acceptance limits (90-110% and 80-120%, respectively).

Qualification: None required.

Continuing Calibration Verifications (CCVs)
All mid-level and high-level CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial Calibration Blanks (ICBs)
No metals were detected in any of the ICBs.

Qualification: None required.

Continuing Calibration Blanks (CCBs)
Low-level detections of arsenic and manganese were detected in some CCBs; however, in all such instances, the detections were at concentrations of only slightly greater than the detection limits and, as such, not clearly distinguishable from instrument noise. Also, none of the affected CCBs were associated with any of the samples for which low-level detections (arsenic only) were reported.

Qualification: None required.

Interference Check Samples (ICS-A and -AB)
ICS-A and ICS-AB solutions are analyzed at the beginning of the analytical run, following the ICAL and analysis of the ICV and ICB. The absolute values reported for arsenic and manganese in all ICS-A solutions were less than the magnitude of the limits of detection (LODs). The recoveries of arsenic and manganese in the analysis of the ICS-AB solutions were within the acceptance range of 80-120%.

Qualification: None required.

Internal Standards
A representative subset of the data for internal standard (yttrium) were reviewed from the raw data. Instrument readings were consistent from one sample to the next, and the %RSDs of the multiple instrument readings were acceptable (less than 5% in these spot-checks of the raw data).

Qualification: None required.

Analyte Quantitation
Twenty samples required dilutions, by factors of between five and 100, to allow accurate quantitation of manganese. No other dilutions were required. No issues associated with the analytical findings, other than as previously described, were noted.

Qualification: None required.

3.2 Arsenic (EPA Method 7010)

The 12 samples reanalyzed for arsenic by GFAA (EPA Method 7010) underwent acid digestion as part of a single preparation batch.

Method Blanks
A low concentration of arsenic was detected in the method blank (0.15 mg/Kg). Arsenic was detected in all 12 of the soil samples, at concentrations ranging from 0.39 mg/Kg in sample DU1A-SU44R1 to 1.3 mg/Kg in sample DU1A-SU48. Two sample results (DU1A-SU44R1 at 0.39 mg/Kg and DU1B-SU30S2 at 0.74 mg/Kg) were less than the artifact threshold value of five times the concentration detected in the method blank (0.15 mg/Kg x 5 = 0.75 mg/Kg).

Qualification: The detections of arsenic reported for samples DU1A-SU44R1 (0.39 mg/Kg) and DU1B-SU30S2 (0.74 mg/Kg) by GFAA were less than the artifact threshold value of five times the concentration of arsenic detected in the method blank (0.15 mg/Kg x 5 = 0.75 mg/Kg) and, therefore, were classified as non-detections at the reported concentrations.

Laboratory Control Samples (LCSs)
The recovery of arsenic reported for the single LCS analyzed by GFAA (97%) was within project acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)
Additional volumes of sample DU1A-SU44R1 were used for MS/MSD analyses. The MS/MSD recoveries (246% and 219%) greatly exceeded the control limits (80-120%) and indicate positive analytical bias. The analyte was detected at an estimated concentration of 0.39 mg/Kg in the parent sample, with the result previously classified as a non-detection due to the presence of the analyte in the method blank.

Qualification: The elevated MS/MSD recoveries were included as an additional reason for qualification of the result for arsenic reported for parent sample DU1A-SU44R1. The final validation qualifier assigned to this result therefore was modified from U to UJ.

Serial Dilutions / Post-Digestion Spikes (SDs/PDSs)
The laboratory analyzed a five-fold SD of sample DU1A-SU44R1 and a PDS of this sample. The five-fold SD result was not valid due to the low concentration of the analyte in the undiluted parent sample. The PDS recovery (105%) was within acceptance limits (80-120%).

Qualification: None required.

Laboratory Triplicates
The laboratory performed triplicate analyses of sample DU1A-SS44R1. Although the result for the primary sample (0.39 mg/Kg) was classified as a non-detection, based on the presence of arsenic in the

method blank, the value was used to calculate the %RSD, along with detections of 0.73 mg/Kg and 0.90 mg/Kg reported for the two replicate analyses. The resulting %RSD (38.6%) exceeds the project control limit of 15%.

Qualification: The ADR.net software applied a J qualifier to the primary sample result of 0.39 mg/Kg based on a calculated %RPD. This qualifier was removed by the validator and, instead, a J was entered into the field for laboratory triplicates, based on the %RSD of 38.6%.

Initial Calibrations (ICALs)

The ICAL, performed with a blank and five standards, met requirements for linearity, with a correlation coefficient (r^2) of 0.9992.

Qualification: None required.

Initial Calibration Verification

The ICV, analyzed following the ICAL, was acceptable (104%).

Qualification: None required.

Continuing Calibration Verifications (CCVs)

All CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial and Continuing Calibration Blanks (ICBs/CCBs)

An ICB was not identified as such. However, a CCB was analyzed immediately after the ICV and after every ten samples. No arsenic was detected in these CCBs.

Qualification: None required.

Analyte Quantitation

Low-level detections of arsenic were reported for all 12 samples, with two of these detections classified as non-detections based on the presence of arsenic in the method blank. A comparison of the results generated by Method 7010 (GFAA) with those generated by Method 6010C (ICP-AES) indicated overall agreement in results. As indicated by the MS/MSD recoveries, the results generated by GFAA may reflect some positive bias; as such, the results generated by ICP-AES may be more accurate, despite being less than the LOQ.

ERT Sample ID	QC Type	Method 7010 (GFAA)		Method 6010C (ICP-AES)	
DU1A-SU26		0.91		0.79	J
DU1A-SU44R1	FT	0.39	UJ	0.45	J
DU1A-SU44R2		1.2		0.38	J
DU1A-SU44R3		1.1		1.4

DU1B-SU30S1	FT	0.76	J	0.6	J
DU1B-SU30S2		0.74	U	0.71	J
DU1B-SU30S3		0.91		0.6	J
DU1B-SU44R1	FT	1		0.57	J

ERT Sample ID	QC Type	Method 7010 (GFAA)	Method 6010C (ICP-AES)	
DU1B-SU44R2		1.1	0.6	J
DU1B-SU44R3		0.82	0.32	J
DU1B-SU48		1.1	0.19	J

Qualification: None required.

4.0 Final Validation Qualifiers

Of 184 discrete results reported for the 86 project samples, only five results were qualified as a result of the validation (Attachment A). An additional 12 detections of arsenic were reported by the laboratory with J qualifiers as they were less than the LOQ; these qualifiers were retained as final validation qualifiers. No results were rejected or recommended for exclusion; therefore, analytical completeness in terms of usable data is 100%.

HSW Project No: [redacted]

1.0 Introduction

This Data Validation Report (DVR) is a summary of the review and validation of environmental analytical data for sample delivery group (SDG) 143965 (folders 143965, 144004, and 144017). The analytical work was performed by CT Laboratories, LLC, Baraboo, Wisconsin (CT). The analytical data were validated in accordance with specifications given in the document titled *Final Uniform Federal Policy – Quality Assurance Project Plan for Depot-wide Remedial Investigation / Feasibility Study for Arsenic and Manganese in Soil at the Former Curtis Bay Ordnance Depot, Anne Arundel County, Maryland (February 2019)* (UFP QAPP). This document was prepared by ERT, Inc., Laurel, Maryland, for the U.S. Army Corps of Engineers (USACE) under Contract No. [redacted] Delivery Order [redacted]

Validation qualifiers were those defined by in the UFP QAPP and are summarized as follows. Definitions of commonly-used terms and acronyms used in this DVR but not expressly defined can be found in the document cited above or in the laboratory data package.

Data Validation Qualifier	Definition
U	The analyte was analyzed for but was not detected above the level of the reported sample limit of detection.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
J+	The result is an estimated quantity, but the result may be biased high.
J-	The result is an estimated quantity, but the result may be biased low.
UJ	The analyte was analyzed for but was not detected. The reported limit of detection is approximate and may be inaccurate or imprecise.
R	The data are unusable. Sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.

The analytical deliverables conformed to Level IV (or Stage 4) reporting as defined by the U.S. Environmental Protection Agency (USEPA) in the document titled *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA 540-R-08-005). Validation was limited to Level III (Stage 2b) deliverables as defined in this guidance document.

A combination of automated and manual means was used to validate the data, with Stage 2a electronic data deliverables (SEDD 2a) processed through ADR.net automated data review software against criteria established in an electronic quality assurance project plan (eQAPP) prepared by ERT with input from CT. This automated review was supplemented by a manual review of non-ADR.net-processable information (e.g., case narratives, instrument calibration data, etc.).

2.0 General Information

The following 72 soil samples, collected by the incremental sampling methodology (ISM), were submitted for laboratory analysis of arsenic and manganese. The laboratory prepared the samples in accordance with their standard operating procedure (SOP) GEO-13, which incorporates USACE guidance for preparation of ISM samples. The prepared samples were analyzed for the two target metals by EPA Method 6010C (inductively-coupled plasma-atomic emission spectrometry [ICP-AES]). Two samples for which results for arsenic were less than the laboratory's limit of quantitation (LOQ) by EPA Method 6010C were reanalyzed for arsenic by EPA Method 7010 (graphic furnace atomic absorption [GFAA] spectrophotometry), which has greater sensitivity and lower LOQ than does Method 6010C.

2.1 Sample Delivery and Condition Upon Receipt

The chain-of-custody (COC) forms were reviewed and deemed acceptable. The samples were received by the laboratory in good condition, in sufficient quantities, and at acceptable temperatures. Copies of USACE and USEPA authorization to use a puck mill for grinding the samples (rather than a ball mill, as had been specified in the UFP QAPP) were included in the Level IV analytical data deliverable.

Qualification: None required.

2.2 Case Narrative and Completeness

The laboratory data package was reviewed for completeness, with no discrepancies noted. The narrative was thorough in identifying several issues, all of which were taken into consideration as part of the validation process.

Qualification: None required, based on the case narrative or data package completeness.

2.3 Holding Times

The samples were prepared and analyzed for target analytes (metals only) within required holding times.

Qualification: None required.

2.4 Field Quality Control (QC) Samples

2.4.1 Field-Generated Blanks

No field-generated blanks were required, as noted in the UFP QAPP.

Qualification: None required.

2.4.2 Field Replicates

Field replicates (triplicates) were collected at six ISM sampling locations and identified with suffixes of R1, R2, and R3. The UPF QAPP gives a precision goal of 30% RSD for field triplicates. This limit was exceeded for arsenic for three of the six triplicates, including locations DU1B-SU36R1 (30.35% RSD), DU1A-SU36R2 (36.35% RSD), and DU4A-SU07R1 (34.22% RSD) (refer to the Field Triplicate RSD Report included as an attachment to this DVR).

Qualification: No qualifications were made based on %RSD exceedances alone. However, the variability in triplicate results will be taken into consideration by the project team in estimating the level of confidence in the representativeness of discrete samples and in utilizing the data for decision-making purposes.

3.0 Analytical Data

The soil samples underwent sieving and grinding, followed by acid digestion, in any one of five preparation batches. One of these batches was for reanalysis of two samples (DU1B-SU14 and DU4B-SU05) for arsenic by GFAA (EPA Method 7010); all others were for arsenic and manganese by ICP-AES (EPA Method 6010C).

3.1 Metals (EPA Method 6010C)

Method Blanks
Trace levels of arsenic were detected in two of the four method blanks, and low levels of manganese were detected in all four of these method blanks. In all instances, the concentrations of arsenic and manganese exceeded the artifact threshold values of five times the concentrations detected in the corresponding method blank such that no qualification of the sample data was necessary.

Qualification: None required.

Laboratory Control Samples (LCSs)
The recoveries of arsenic and manganese reported for the four LCSs analyzed by ICP-AES were within project acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)
Additional volumes of samples DU1B-SU13, DU1A-SU13, DU1A-SU34, DU1B-SU34, DU1B-SU10R3, DU4A-SU04, and DU4B-SU04 were used for MS/MSD analyses of arsenic and manganese. All recoveries met validation acceptance criteria; i.e., all either were within acceptance limits or were not meaningful because the spike concentration was less than one-fourth the concentration in the parent sample (i.e., measurement of the spike concentrations was obscured by routine analytical measurement uncertainty).

Qualification: None required.

Serial Dilutions (SDs)
The laboratory analyzed five-fold SDs of samples DU1B-SU13, DU1B-SU34, DU1B-SU10R3, DU4B-SU04, and DU1A-SU13 for manganese. The percent differences (%Ds) for each of these five SDs were within 10% of the parent sample result and therefore were acceptable.

Qualification: None required.

Post-Digestion Spikes (PDSs)
The laboratory performed PDS analyses of samples DU1A-SU13, DU1B-SU13, DU1A-SU34, DU1B-SU34, DU1B-SU10R3, DU4A-SU04, and DU4B-SU04 for arsenic and manganese. All recoveries were within the acceptance range (80-120%).

Qualification: None required.

Laboratory Duplicates and Triplicates
The laboratory performed triplicate analyses of samples DU1B-SU13, DU1A-SU36R2, DU1A-SU34, DU1B-SU34, DU1A-SU10R3, DU1B-SU10R3, DU4A-SU04, and DU4B-SU04 and duplicate analyses of sample DU1A-SU13. The laboratory's information management system (LIMS) is not capable of calculating and reporting %RSDs for triplicates (i.e., only %RPDs were reported in the Level IV data package and in the SEDD 2a); therefore, %RSDs for triplicate results were manually calculated by the validator and compared with the limit of 15% RSD given in the UFP QAPP and eQAPP. As summarized below, limits for

%RSD for laboratory triplicates (and %RPDs for laboratory duplicates) were exceeded in several instances.

Analyte	ERT Sample ID	Sample Type	Result	Lab Qualifier	RSD (%)	RPD (%)	LOD	LOQ

Qualification: Sample results for which %RSDs for laboratory triplicate analyses or %RPDs for laboratory duplicate analyses exceeded the limits of 15% and 20%, respectively, were classified as less than fully representative of the sample and were coded with J validation qualifiers.

Initial Calibrations (ICALs)

The multi-point ICALs of arsenic and manganese, performed daily, met requirements for linearity, with all correlation coefficient (r^2) values approximating 1.0.

Qualification: None required.

Initial Calibration Verifications and Lower Limit of Quantitation Checks (ICVs / LLQCs)

ICVs and LLQCs were analyzed following each ICAL. All ICV and LLQC recoveries were within acceptance limits (90-110% and 80-120%, respectively).

Qualification: None required.

Continuing Calibration Verifications (CCVs)

All mid-level and high-level CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial Calibration Blanks (ICBs)

No metals were detected in any of the ICBs.

Qualification: None required.

Continuing Calibration Blanks (CCBs)

No arsenic or manganese were detected in any of the CCBs.

Qualification: None required.

Interference Check Samples (ICS-A and -AB)
ICS-A and ICS-AB solutions are analyzed at the beginning of the analytical run, following the ICAL and analysis of the ICV and ICB. The absolute values reported for arsenic and manganese in all ICS-A solutions were less than the magnitude of the limits of detection (LODs). The recoveries of arsenic and manganese in the analysis of the ICS-AB solutions were within the acceptance range of 80-120%.

Qualification: None required.

Internal Standards
A representative subset of the data for internal standard (yttrium) were reviewed from the raw data. Instrument readings were consistent from one sample to the next, and the %RSDs of the multiple instrument readings were acceptable (less than 5% in these spot-checks of the raw data).

Qualification: None required.

Analyte Quantitation
Seven samples required dilutions, by factors of five, ten, or 30, to allow accurate quantitation of manganese. No other dilutions were required. No issues associated with the analytical findings, other than as previously described, were noted.

Qualification: None required.

3.2 Arsenic (EPA Method 7010)

The two samples reanalyzed for arsenic by GFAA (samples DU1B-SU14 and DU4B-SU05) underwent acid digestion as part of a single preparation batch.

Method Blanks
A low concentration of arsenic was detected in the method blank (0.15 mg/Kg). Arsenic was detected in both samples, at concentrations of 1.6 mg/Kg in sample DU1B-SU14 and 0.79 mg/Kg in sample DU4B-SU05. These results exceed the artifact threshold value of five times the concentration detected in the method blank (0.15 mg/Kg x 5 = 0.75 mg/Kg).

Qualification: None required.

Laboratory Control Samples (LCSs)
The recovery of arsenic reported for the single LCS analyzed by GFAA (97%) was within project acceptance limits.

Qualification: None required.

Matrix Spike / Matrix Spike Duplicates (MS/MSDs)
Neither sample was used for MS/MSD analyses. However, samples DU1B-SU14 and DU4B-SU05 were batched with other CBD soil samples and for which project-specific MS/MSD analyses were performed (sample DU1A-SU44R1 was used; refer to the DVR for laboratory deliverable 143765).

Qualification: None required.

Serial Dilutions / Post-Digestion Spikes (SDs/PDSs)
SD and PDS analyses were performed with sample DU1A-SU44R1 and the results described in the DVR for laboratory deliverable 143765.

Qualification: None required.

Laboratory Triplicates
The laboratory performed triplicate analyses of sample DU1B-SU14 by Method 7010. The resulting %RSD (15.2%), after rounding, is within the project control limit (15% RSD).

Qualification: None required.

Initial Calibrations (ICALs)
The ICAL, performed with a blank and five standards, met requirements for linearity, with a correlation coefficient (r^2) of 0.9992.

Qualification: None required.

Initial Calibration Verification
The ICV, analyzed following the ICAL, was acceptable (104%).

Qualification: None required.

Continuing Calibration Verifications (CCVs)
All CCVs bracketing the analysis of the project soil samples were within acceptance limits (90-110%).

Qualification: None required.

Initial and Continuing Calibration Blanks (ICBs/CCBs)
An ICB was not identified as such. However, a CCB was analyzed immediately after the ICV and after every ten samples and bracketing the analysis of the two project samples. No arsenic was detected in these CCBs.

Qualification: None required.

Analyte Quantitation
A comparison of the results generated by Method 7010 (GFAA) with those generated by Method 6010C (ICP-AES) indicated overall agreement in results.

ERT Sample ID	QC Type	Method 7010		Method 6010C	
DU1B-SU14		1.6		0.47	J
DU4B-SU05		0.79	J	0.81	J

Qualification: None required.

4.0 Final Validation Qualifiers

Of 146 discrete results reported for the 72 project samples, only seven results were qualified as a result of the validation (Attachment A). An additional three detections of arsenic were reported by the

laboratory with J qualifiers as they were less than the LOQ; these qualifiers were retained as final validation qualifiers. No results were rejected or recommended for exclusion; therefore, analytical completeness in terms of usable data is 100%.

BTAG - USEPA Region III Biological Technical Assistance Group Screening Benchmarks (USEPA, 1995)

RSL - USEPA Regional Screening Level, November 2018

BTV - Site-specific background threshold value

UCL - Upper Confidence Limit of the Mean

Results exceeding the Industrial Soil RSL are shaded.

Results exceeding the Residential Soil RSL are in bold font.

Results exceeding the BTAG screening level are in red font.

Underlined results exceed the BTV.

mg/kg - milligrams per kilogram

"J" - estimated value

"J-" - estimated value may be biased low

"U" - not detected at concentrations greater than the limit of detection (LOD). LOD is shown.

NSL - No Screening Limit

The data contained in the following report have been reviewed by the appropriate CT Laboratories' LLC staff members. In addition, CT Laboratories LLC certifies that to the best of our knowledge that the analyses reported herein are true, complete and correct within the limits of the methods employed and that they follow the applicable requirements as specified by the project plan, state-specific, NELAC or DOD QSM requirements. The estimated uncertainty of measurement is only available upon request. The reported results relate only to the tested samples. This report shall not be reproduced, except in full, without written approval of CT Laboratories LLC.

Case Narrative

Client: ERT, Inc.
Project: Former Curtis Bay Ordnance Depot – Arsenic & Manganese RI/FS; Anne Arundel County, MD
Sample Receipt Dates: 03/12/2019, 03/13/2019, & 03/14/2019
SDG #: 143438 (Folders 143438, 143477, & 143517)

Thirty-four ISM samples were received and analyzed for Arsenic and Manganese. Prior to analysis, the ISM samples were dried, sieved, and ground following the homogenization procedure outlined by the client. The assigned sample ID number, date sampled, and date received are indicated in the attached Project Summary. The samples were received intact and at a temperature within method specified acceptance limits. A breakdown of sample receipt information can be found on the Sample Condition Report located in the last section of the data package and any exceptions are noted below. The analyses were performed following DOD QSM 5.

Manual integrations have been performed on the data provided with this package. If manual integrations were performed, a Reason #(s) was included on the raw data that corresponds to the "Index Key for Manual Integration Rationale". The raw data includes a "Before" and "After" manual integration illustration. The manual integrations were initialed and dated by the analyst, as well as, by the person reviewing the data.

Sample Analysis and Quality Control

Metals Analysis:

The samples were analyzed using US EPA Method 6010C (ICP Metals). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

ICP Arsenic & Manganese (6010C) Soil Analysis

Continuing Calibration Verification (CCV) standards were analyzed at two levels (CCV1 & CCV2) with potentially differing wavelengths. Data associated with CCV's were evaluated based on the concentration of the element in the samples and compared to the appropriate CCV level/wavelength.

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Analytical Run # 158872

Manganese was detected in the Method Blank (MB) above the Method Detection Limit (MDL) and greater than ½ the Reporting Limit (RL). The samples were reported and not reanalyzed because the MB result was less than 1/10th of the sample results.

The Serial Dilution (L) for sample # 251121 was not applicable for arsenic because the parent sample raw result was less than 50 times the Limit of Quantitation (LOQ). A Post Digestion Spike (PDS) was analyzed and was unacceptable. The parent sample was reported and qualified with an "M" flag for arsenic.

The L for sample # 251121 was not acceptable for manganese because the result exceeded the Relative Percent Difference (RPD) limit. A PDS was analyzed and was unacceptable. The parent sample was reported and qualified with an "M" flag for the failing element.

The Triplicate (TRIP) for sample # 251121 was not acceptable because the results exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing elements.

The Matrix Spike (MS) and Matrix Spike Duplicate (MSD) for sample # 251121 had outside recoveries for arsenic and manganese. A PDS was analyzed and was unacceptable. The parent sample was reported and qualified with an "M" flag for the failing elements.

The TRIP for sample # 251131 was not acceptable for arsenic because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

Analytical Run # 158900

Arsenic was detected in the MB greater than the MDL but less than ½ the RL. The samples were reported and not qualified because the MB arsenic result was less than 1/10th of the sample arsenic results.

Manganese was detected in the MB above the MDL and greater than ½ the RL. The samples were reported and not reanalyzed because the MB result was less than 1/10th of the sample results.

The TRIP for sample # 251141 was not applicable for arsenic because the parent sample result was less than five times the LOQ. An MSD was not analyzed. The parent sample was reported and not qualified.

The L for sample # 251667 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was acceptable. The parent sample was reported and not qualified.

The MSD for sample # 251667 had an outside recovery for arsenic. A PDS was analyzed and was acceptable. The parent sample was reported and not qualified.

The L for sample # 251668 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was acceptable. The parent sample was reported and not qualified.

The L for sample # 251668 was not acceptable for manganese because the result exceeded the RPD limit. A PDS was analyzed and was acceptable. The parent sample was reported and not qualified.

Data Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was not above the detection level.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

CT LABORATORIES

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.

Of this Base standard, pipet **10 mL** into a 500 mL volumetric flask to create a working std or **1 mL** into a 50 mL digestion tube for a digested working standard.

Standard Log #:	M13554	Instrument:	ICP
Analyst:	[redacted]	Standard:	LOQ 3010 B&Si Spiking Solution
Prep Date:	07/13/2018	Expiration Date:	05/2019

Prep:

Into a 1 L volumetric flask, pipetted the following and brought up to volume with Milli-Q H_2O. (5% HNO_3)

Analyte	Final MDL Conc. (ug/L)	Std. ID #	Std. Conc. (mg/L)	Volume (mL) pipetted
B	16	M13390	1000	0.8
Si	200	M13338	1000	10

Of this base standard, pipetted **1 mL** into a 50 mL digestion tube for a digested working standard.

Standard Log #:	M13555	Instrument:	ICP
Analyst:	[redacted]	Standard:	LOQ 3010 S Spiking Solution
Prep Date:	07/13/2018	Expiration Date:	10/2019

Prep:

Into a 1 L volumetric flask, pipetted the following and brought up to volume with Milli-Q H_2O. (5% HNO_3)

Analyte	Final MDL Conc. (ug/L)	Std. ID #	Std. Conc. (mg/L)	Volume (mL) pipetted
S	200	M13466	10000	1.0

Of this base standard, pipetted **1 mL** into a 50 mL digestion tube for a digested working standard.

Prep:

Using 1 L volumetric flasks, pipetted the following and brought up to volume using milli-Q H_2O.
(5% HNO_3, 5% HCl)
1000 ug/L Std. - **10 mL** of Custom Assurance Std. #23 (100 mg/L Al, As, B, Ba, Ca, Co, Cr, Cu, Fe, Li, Mg, Mn, Mo, Ni, Pb, Sb, Se, Sn, Sr, Ti, Tl, V, Zn) M13518 , **10 mL** of Custom Assurance Std. #3 (100 mg/L Ag, Be, Cd) M13506 and **1 mL** of Si (1000 mg/L) M13394 and 1 mL M13203 Ce
0.25 ug/L Std. - **0.25 mL** of the 1000 ug/L Std.
0.5 ug/L Std. - **0.5 mL** of the 1000 ug/L Std.
1 ug/L Std. - **1 mL** of the 1000 ug/L Std.
5 ug/L Std. - **5 mL** of the 1000 ug/L Std.
10 ug/L Std. - **10 mL** of the 1000 ug/L Std.
20 ug/L Std. - **20 mL** of the 1000 ug/L Std.
50 ug/L Std. - **50 mL** of the 1000 ug/L Std.
100 ug/L Std. - **1 mL** of Custom Assurance Std. (CAS) #23 and **1 mL** of CAS #3
10,000 ug/L Std. - **100 mL** CAS #23, **100 mL** CAS #3 and **1 mL** of K (10,000 mg/L) M13465 .
100k ug/L Std. - **10 mL** of Cu (10,000 mg/L) M13166 , **10 mL** of Mn (10,000 mg/L) M13167 , **10 mL** of Cr (10,000 mg/L) M13165 , **10 mL** Pb (10,000 mg/L) M13169 , **10 mL** of Zn (10,000 mg/L) M13168 and **10 mL** of Na (10,000 mg/L) M13461 .
100,000 ug/L Std. - **10 mL** of Mg (10,000 mg/L) M13319 , **10 mL** of Fe (10,000 mg/L) M13463 , **10 mL** of Ca (10,000 mg/L) M13467 and **10 mL** Al (10,000 mg/L) M13462 .
500,000 ug/L Std. - **50 mL** of Mg (10,000 mg/L), **50 mL** of Fe (10,000 mg/L), **50 mL** of Ca (10,000 mg/L) and **50 mL** of Al (10,000 mg/L)
1000k ug/L Std. - **100 mL** of Mg (10,000 mg/L), **100 mL** of Fe (10,000 mg/L), **100 mL** of Ca (10,000 mg/L) and **100 mL** of Al (10,000 mg/L)

Prep:

Using 1 L volumetric flasks, pipetted the following and brought up to volume using milli-Q H_2O.
(5% HNO_3, 5% HCl)
1000 ug/L Std. - **10 mL** of Custom Assurance Std. #23 (100 mg/L Al, As, B, Ba, Ca, Co, Cr, Cu, Fe, Li, Mg, Mn, Mo, Ni, Pb, Sb, Se, Sn, Sr, Ti, Tl, V, Zn) M13252 , **10 mL** of Custom Assurance Std. #3 (100 mg/L Ag, Be, Cd) M13217 and **1 mL** of Si (1000 mg/L) M13085 and 1 mL M13203 Ce
0.25 ug/L Std. - **0.25 mL** of the 1000 ug/L Std.
0.5 ug/L Std. - **0.5 mL** of the 1000 ug/L Std.
1 ug/L Std. - **1 mL** of the 1000 ug/L Std.
5 ug/L Std. - **5 mL** of the 1000 ug/L Std.
10 ug/L Std. - **10 mL** of the 1000 ug/L Std.
20 ug/L Std. - **20 mL** of the 1000 ug/L Std.
50 ug/L Std. - **50 mL** of the 1000 ug/L Std.
100 ug/L Std. - **1 mL** of Custom Assurance Std. (CAS) #23 and **1 mL** of CAS #3
10,000 ug/L Std. - **100 mL** CAS #23, **100 mL** CAS #3 and **1 mL** of K (10,000 mg/L) M13233 .
100k ug/L Std. - **10 mL** of Cu (10,000 mg/L) M13166 , **10 mL** of Mn (10,000 mg/L) M13167 , **10 mL** of Cr (10,000 mg/L) M13165 , **10 mL** Pb (10,000 mg/L) M13169 , **10 mL** of Zn (10,000 mg/L) M13168 and **10 mL** of Na (10,000 mg/L) M13135 .
100,000 ug/L Std. - **10 mL** of Mg (10,000 mg/L) M13236 , **10 mL** of Fe (10,000 mg/L) M13235 , **10 mL** of Ca (10,000 mg/L) M13237 and **10 mL** Al (10,000 mg/L) M13232 .
500,000 ug/L Std. - **50 mL** of Mg (10,000 mg/L), **50 mL** of Fe (10,000 mg/L), **50 mL** of Ca (10,000 mg/L) and **50 mL** of Al (10,000 mg/L)
1000k ug/L Std. - **100 mL** of Mg (10,000 mg/L), **100 mL** of Fe (10,000 mg/L), **100 mL** of Ca (10,000 mg/L) and **100 mL** of Al (10,000 mg/L)

		Method: Multi-Incremental Soil Homogenization (8330B Explosives)			
LIMS Run #(s)	**Analysis Date**	**Analyst / Data Interpreter**	**Independent Reviewer**	**Date of Review**	**Approved? (Yes or No)**
159090	03/14/2019	[redacted]	[redacted]	03/15/2019	Yes

Instructions: Complete one checklist per *analytical run* . Enter the appropriate response for each question.
Each "No" response requires an explanation in the Comments section, and may require the initiation of a Nonconformance Report.

Requirement:	**Acceptance Criteria**	**Analyst Review**		**Independent Review**		**Comments:**
		Yes	No	Yes	No	(indicate reference to an attachment if necessary)
1. Were samples dried to a constant weight?	Dry and crumbly to the touch and % Solids >95%	Yes		Yes		If No: See PM for further instruction
2. Was the date and time recorded for each sample on the bench sheet?	---	Yes		Yes		If No: Enter the dates and times
3. Was the ambient temperature recorded on the bench sheet?	Should be recorded daily	Yes		Yes		If No: Check daily temperature logbook to find the ambient temperature and record on the bench sheet.
4. Were all the samples sieved and ground?	---	Yes		Yes		
5. Was the initial sample weight recorded on the bench sheet for all samples?	---	Yes		Yes		
6. Was the amount of sample retained on the #10 Sieve recorded on the bench sheet for each sample?	---	Yes		Yes		
7. Were multiple grinds required?	---	Yes		Yes		If Yes: Notify the PM
8. Was a grinding (sand) blank processed at the appropriate frequency?	One after every 10 samples or project/program-specific frequency	Yes		Yes		If No: Grind the appropriate number of sand blanks for the current batch of samples
9. Are all samples on the job lists accounted for?	---	Yes		Yes		If No: Analyze samples that were missed.
10. Were nonconformities (if applicable) documented in the NCR spreadsheet?	---	Yes		Yes		If No: Enter nonconformities into the NCR spreadsheet before data review/validation.

159132	03/16/2019 - 03/18/2019	[redacted]	[redacted]	03/18/2019	Yes

Instructions: Complete one checklist per *analytical run* . Enter the appropriate response for each question.
Each "No" response requires an explanation in the Comments section, and may require the initiation of a Nonconformance Report.

Requirement:	**Acceptance Criteria**	**Analyst Review**		**Independent Review**		**Comments:**
		Yes	No	Yes	No	(indicate reference to an attachment if necessary)
1. Were samples dried to a constant weight?	Dry and crumbly to the touch and % Solids >95%	Yes		Yes		If No: See PM for further instruction
2. Was the date and time recorded for each sample on the bench sheet?	---	Yes		Yes		If No: Enter the dates and times
3. Was the ambient temperature recorded on the bench sheet?	Should be recorded daily	Yes		Yes		If No: Check daily temperature logbook to find the ambient temperature and record on the bench sheet.
4. Were all the samples sieved and ground?	---	Yes		Yes		
5. Was the initial sample weight recorded on the bench sheet for all samples?	---	Yes		Yes		
6. Was the amount of sample retained on the #10 Sieve recorded on the bench sheet for each sample?	---	Yes		Yes		
7. Were multiple grinds required?	---	Yes		Yes		If Yes: Notify the PM
8. Was a grinding (sand) blank processed at the appropriate frequency?	One after every 10 samples or project/program-specific frequency	Yes		Yes		If No: Grind the appropriate number of sand blanks for the current batch of samples
9. Are all samples on the job lists accounted for?	---	Yes		Yes		If No: Analyze samples that were missed.
10. Were nonconformities (if applicable) documented in the NCR spreadsheet?	---	Yes		Yes		If No: Enter nonconformities into the NCR spreadsheet before data review/validation.

CT Laboratories Terms and Conditions

Where a purchaser (Client) places an order for laboratory, consulting or sampling services from CT Laboratories (CTL), CTL shall provide the ordered services pursuant to these Terms and Conditions, and the related Quotation, or as agreed in a negotiated contract. In the absence of a written agreement to the contrary, the Order constitutes an acceptance by the Client of CTL's offer to do business under these Terms and Conditions, and an agreement to be bound by these Terms and Conditions. No contrary or additional terms and conditions expressed in a Client's document shall be deemed to become a part of the contract created upon acceptance of these Terms and Conditions, unless accepted by CTL in advance of the start of the project and in writing.

1. ORDERS AND RECEIPT OF SAMPLES (Sample Acceptance Policy)

1.1 The Client may place the Order (i.e., specify a Scope of Work) either by submitting a purchase order to CTL in writing, by telephone (confirmed in writing) or by negotiated contract. Whichever option the Client selects for placing the Order, the Order shall not be valid unless it contains sufficient information to enable CTL to carry out the Client's requirements. It is the policy of CTL that samples not meeting the acceptance criteria, outlined in the NELAC standards and Section 5.8.3.2 of the DOD QSM, will not be accepted by the laboratory or will be qualified on the final report. All samples submitted to the laboratory must: (a) be accompanied by proper, full and complete documentation, including sample identification, location, date and time of collection, the collector's name, type of preservation (if any), type of sample, any special comments concerning the sample and any additional pertinent fields on the chain-of-custody. In the absence of any of the required information, the laboratory will attempt to contact the client to obtain the information; if unable to obtain the necessary information, the final report will be qualified.
(b) samples must be labeled appropriately with a unique sample identification written with indelible ink on water resistant labels. If the laboratory cannot determine the identity of a sample, it may be rejected and the client will be contacted for further instructions or resampling. (c) samples must be in an appropriate sample container. If the container is inappropriate, the client will be contacted for further instructions or resampling. If analysis is possible, the final report will be qualified. CTL can provide a sampling guide containing approved containers and preservations for analytical methods requested. (d) adhere to method specified holding times. If samples are received with less than ½ the holding time remaining for the requested test, CTL will make its best effort to analyze the samples and notify the client. If holding times are exceeded, the final report will be qualified. (e) contain adequate sample volume to perform the necessary testing. If sufficient volume is not present, the sample may be rejected and the client will be contacted for further instructions or resampling. If samples show signs of damage, contamination or inadequate preservation, the client will be notified. If analysis can be performed, the final report will be qualified. If not, the samples will be rejected and the client notified for further instructions or resampling. It is the Client's responsibility to understand and package samples correctly and provide the proper amount of temperature control (ice) suitable to current weather conditions.
1.2 CTL must be supplied with complete written disclosure of the known or suspected presence of any hazardous substances, as defined by applicable federal or state law. Where any samples which were not accompanied by the required disclosure, cause interruptions in the lab's ability to process work due to contamination of instruments or work areas, the Client will be responsible for the costs of clean up and recovery.
1.3 Prior to Sample Acceptance, the entire risk of loss or damage to samples remains with the Client. In no event will CTL have any responsibility or liability for the action or inaction of any carrier shipping or delivering any sample to or from CTL's premises. Client is responsible to assure that any sample containing any hazardous substance which is to be delivered to CTL's premises will be packaged, labeled, transported and delivered properly and in accordance with applicable laws.
1.4 Clients using CTL's shipping account(s) do so at their own risk and must purchase separate insurance if they do not wish to assume risk of loss. CTL will not assume any risk whatsoever for any samples outside of CTL's control and not successfully delivered to the laboratory within specified hold times.
1.5 CTL will not accept liability for any sample(s), except sample(s) damaged or broken by log-in staff prior to successful log-in of the sample(s) into the CTL- LIMS system. This includes, but may not be limited to: complete, valid COC documentation, all sample receiving issues being resolved from a delay caused by the Client in CTL's ability to log-in samples, including missed turnaround and hold times, delay in processing and, ultimately, additional charges to the Client.
1.6 CTL will only reject samples per directions from the Client. CTL's sole liability is to inform the Client of any sample receipt issues, and may provide an indication how proceeding with the analysis may affect results and final acceptance by the regulating agency. Ultimately, suitability for use is between the Client and the regulating agency(s).
1.7 Signing of this COC by the Client or Client's representative, or directions to CTL via email or Fax constitutes acceptance of these Terms and Conditions, and guarantees payment by the Client to CTL.

2. PAYMENT TERMS

2.1 Services performed by CTL will be in accordance with prices quoted and later confirmed in writing or as stated in the Price Schedule. Invoices may be submitted to Client upon completion of any sample delivery group. Payment in advance is required for all Clients except those whose credit has been established with CTL. For Clients with approved credit, payment terms are net 30 days from the date of invoice by CTL. All overdue payments are subject to an additional interest and service charge of one and one-half percent (1.5%) or the maximum rate permissible by law, per month or portion thereof from the due date until the date of payment. All fees are charged or billed directly to the Client. The billing of a third party will not be accepted without a statement, signed by the third party that acknowledges and accepts payment responsibility. CTL may suspend work and withhold delivery of data under this order at any time in the event Client fails to make timely payment of its invoices. Client shall be responsible for all costs and expenses of collection including reasonable attorney's fees. CTL reserves the right to refuse to proceed with work at any time based upon an unfavorable Client credit report.

3. CHANGE ORDERS, TERMINATION

3.1 Changes to the Scope of Work, price, or result delivery date may be initiated by CTL after Sample Acceptance due to any condition which conflicts with analytical, QA or other protocols warranted in these Terms and Conditions. CTL will not proceed with such changes until an agreement with the Client is reached on the amount of any cost, schedule change or technical change to the Scope of Work, and such agreement is documented in writing.
3.2 Changes to the Scope of Work, including but not limited to increasing or decreasing the work, changing test and analysis specification or acceleration in the performance of the work may be initiated by the Client after sample acceptance. Such a change will be documented in writing and may result in a change in cost and turnaround time commitment. CTL's acceptance of such changes is contingent upon technical feasibility and operational capacity.
3.3 Suspension or termination of all or any part of the work may be initiated by the Client. CTL will be compensated consistent with Section 2 of these Terms and Conditions. CTL will complete all work in progress and be paid in full for all work completed.

4. WARRANTIES AND LIABILITY

4.1 Where applicable, CTL will use analytical methodologies which are in substantial conformity with published test methods. CTL has implemented these methods in its Laboratory Quality Manuals and referenced Standard Operating Procedures and where the nature or composition of the sample requires it, CTL reserves the right to deviate from these methodologies as necessary or appropriate, based on the reasonable judgment of CTL, which deviations, if any, will be made on a basis consistent with recognized standards of the industry and/or CTL's Laboratory Quality Manuals. Client may request that CTL perform according to a mutually agreed Quality Assurance Project Plan (QAPP). In the event that samples arrive prior to agreement on a QAPP, CTL will proceed with analyses under its standard Quality Manuals then in effect, and CTL will not be responsible for any resampling or other charges if work must be repeated to comply with a subsequently finalized QAPP.
4.2 CTL shall start preparation and/or analysis within holding times provided that Sample Acceptance occurs within 48 hours of sampling or 1/2 of the holding time for the test, whichever is less. Samples received that do not meet this provision will be charged as expedited samples and the appropriate rate will be added accordingly. Where resolution of inconsistencies leading to Sample Acceptance does not occur within this period, CTL will use its best efforts to meet holding times and will proceed with the work provided that, in CTL's judgment, the chain-of-custody or definition of the Scope of Work provide sufficient guidance. Reanalysis of samples to comply with CTL's Quality Manuals will be deemed to have met holding times provided the initial analysis was performed within the applicable holding time. Where reanalysis demonstrates that sample matrix interference is the cause of failure to meet any Quality Manual requirements, the warranty will be deemed to have been met.
4.3 CTL warrants that it possesses and maintains all licenses and certifications which are required to perform services under these Terms and Conditions provided that such requirements are specified in writing to CTL prior to Sample Acceptance. CTL will notify the Client in writing of any decertification or revocation of any license, or notice of either, which affects work in progress.
4.4 The warranty obligations set forth in Sections 4.1, 4.2 and 4.3 are the sole and exclusive warranties given by CTL in connection with any services performed by CTL or any Results generated from such services, and CTL gives and makes NO OTHER REPRESENTATION OR WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. No representative of CTL is authorized to give or make any other representation or warranty or modify this warranty in any way.
4.5 Client's sole and exclusive remedy for the breach of warranty in connection with any services performed by CTL, will be limited to repeating any services performed, contingent on the Client's providing, at the request of CTL and at the Client's expense, additional sample(s) if necessary. Any reanalysis requested by the Client generating Results consistent with the original Results will be at the Client's expense. If resampling is necessary, CTL's liability for resampling costs will be limited to actual cost or one hundred or one hundred fifty dollars ($150) per sample, whichever is less.
4.6 CTL's liability for any and all causes of action arising hereunder, whether based in contract, tort, warranty, negligence or otherwise, shall be limited to the lesser amount of compensation for the services performed or $100,000. All claims, including those for negligence, shall be deemed waived unless suit thereon is filed within one year after CTL's completion of the services. Under no circumstances, whether arising in contract, tort (including negligence), or otherwise, shall CTL be responsible for loss of use, loss of profits, or for any special, indirect, incidental or consequential damages occasioned by the services performed or by application or use of the reports prepared.
4.7 In no event shall CTL have any responsibility or liability to the Client for any failure or delay in performance by CTL which results, directly or indirectly, in whole or in part, from any cause or circumstance beyond the reasonable control of CTL. Such causes and circumstances shall include, but not be limited to, acts of God, acts of Client, acts or orders of any governmental authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, equipment breakdown, matrix interference or unknown highly contaminated samples that impact instrument operation, unavailability of supplies from usual suppliers, difficulties or delays in transportation, mail or delivery services, or any other cause beyond CTL's reasonable control.

5. RESULTS, WORK PRODUCT

5.1 Data or information provided to CTL or generated by services performed under this agreement shall only become the property of the Client upon receipt in full by CTL of payment for the whole Order. Ownership of any analytical method, QA/QC protocols, software programs or equipment developed by CTL for performance of work will be retained by CTL, and Client shall not disclose such information to any third party.
5.2 Data and sample materials provided by Client or at Client's request, and the result obtained by CTL shall be held in confidence (unless such information is generally available to the public or is in the public domain or Client has failed to pay CTL for all services rendered or is otherwise in breach of these Terms and Conditions), subject to any disclosure required by law or legal process.
5.3 Should the Results delivered by CTL be used by the Client or Client's client, even though subsequently determined not to meet the warranties described in these Terms and Conditions, then the compensation will be adjusted based upon mutual agreement. In no case shall the Client unreasonably withhold CTL's right to independently defend its data.
5.4 CTL reserves the right to subcontract services ordered by the Client to another laboratory or laboratories, if, in CTL's sole judgment, it is reasonably necessary, appropriate or advisable to do so, and with the Client's permission. CTL will in no way be liable for any subcontracted services and all applicable warranties, guarantees and insurance are those of the subcontracted laboratory.
5.5 CTL shall dispose of the Client's samples and extracts 30 days after the analytical report is issued, unless instructed to store them for an alternate period of time or to return such samples to the Client, in a manner consistent with U.S. Environmental Protection Agency regulations or other applicable Federal, state or local requirements. Additional charges will apply for samples or extracts stored longer than 30 days at the Clients request. Any samples for projects that are canceled or not accepted, or for which return was requested, will be returned to the Client at Client expense. CTL reserves the right to return to the Client any sample or unused portion of a sample that is not within CTL's permitted capability or the capabilities of CTL's designated waste disposal vendor(s), or will make arrangements to dispose of these samples at Client direction and expense.
5.6 Unless a different time period is agreed to in any order under these Terms and Conditions, CTL agrees to retain all records for five (5) years.
5.7 In the event that CTL is required to respond to legal process related to services for Client, Client agrees to reimburse CTL for hourly charges for personnel involved in the response and attorney fees reasonably incurred in obtaining advice concerning the response, preparation to testify, and appearances related to the legal process, travel and all reasonable expenses associated with the litigation.

6. INSURANCE

6.1 CTL shall maintain in force during the performance of services under these Terms and Conditions, Workers' Compensation and Employer's Liability Insurance in accordance with the laws of the states having jurisdiction over CTL's employees who are engaged in the performance of the work. CTL shall also maintain during such period, Comprehensive General and Contractual Liability (limit of $2,000,000 per occurrence/ aggregate), Comprehensive Automobile Liability, owned and hired, ($1,000,000 combined single limit), and Professional/Pollution Liability Insurance (limit of $5,000,000 per occurrence/aggregate). Any Client required changes to these limits or conditions will result in a change in cost to the Client.

7. AUDIT

7.1 Upon prior notice to CTL, the Client may audit and inspect CTL's records and accounts covering reimbursable costs related to work done for the Client, for a period of one (1) year after completion of the work. The purpose of any such audit shall be only for verification of such costs, and CTL shall not be required to provide access to cost records where prices are expressed as fixed fees or published unit prices.

CT Laboratories Terms and Conditions

Where a purchaser (Client) places an order for laboratory, consulting or sampling services from CT Laboratories (CTL), CTL shall provide the ordered services pursuant to these Terms and Conditions, and the related Quotation, or as agreed in a negotiated contract. In the absence of a written agreement to the contrary, the Order constitutes an acceptance by the Client of CTL's offer to do business under these Terms and Conditions, and an agreement to be bound by these Terms and Conditions. No contrary or additional terms and conditions expressed in a Client's document shall be deemed to become a part of the contract created upon acceptance of these Terms and Conditions, unless accepted by CTL in advance of the start of the project and in writing.

1. ORDERS AND RECEIPT OF SAMPLES (Sample Acceptance Policy)

1.1 The Client may place the Order (i.e., specify a Scope of Work) either by submitting a purchase order to CTL in writing, by telephone (confirmed in writing) or by negotiated contract. Whichever option the Client selects for placing the Order, the Order shall not be valid unless it contains sufficient information to enable CTL to carry out the Client's requirements. It is the policy of CTL that samples not meeting the acceptance criteria, outlined in the NELAC standards and Section 5.8.3.2 of the DOD QSM, will not be accepted by the laboratory or will be qualified on the final report. All samples submitted to the laboratory must: (a) be accompanied by proper, full and complete documentation, including sample identification, location, date and time of collection, the collector's name, type of preservation (if any), type of sample, any special comments concerning the sample and any additional pertinent fields on the chain-of-custody. In the absence of any of the required information, the laboratory will attempt to contact the client to obtain the information; if unable to obtain the necessary information, the final report will be qualified. (b) samples must be labeled appropriately with a unique sample identification written with indelible ink on water resistant labels. If the laboratory cannot determine the identity of a sample, it may be rejected and the client will be contacted for further instructions or resampling. (c) samples must be in an appropriate sample container. If the container is inappropriate, the client will be contacted for further instructions or resampling. If analysis is possible, the final report will be qualified. CTL can provide a sampling guide containing approved containers and preservations for analytical methods requested. (d) adhere to method specified holding times. If samples are received with less than ½ the holding time remaining for the requested test, CTL will make its best effort to analyze the samples and notify the client. If holding times are exceeded, the final report will be qualified. (e) contain adequate sample volume to perform the necessary testing. If sufficient volume is not present, the sample may be rejected and the client will be contacted for further instructions or resampling. If samples show signs of damage, contamination or inadequate preservation, the client will be notified. If analysis can be performed, the final report will be qualified. If not, the samples will be rejected and the client notified for further instructions or resampling. It is the Client's responsibility to understand and package samples correctly and provide the proper amount of temperature control (ice) suitable to current weather conditions.

1.2 CTL must be supplied with complete written disclosure of the known or suspected presence of any hazardous substances, as defined by applicable federal or state law. Where any samples which were not accompanied by the required disclosure, cause interruptions in the lab's ability to process work due to contamination of instruments or work areas, the Client will be responsible for the costs of clean up and recovery.

1.3 Prior to Sample Acceptance, the entire risk of loss or damage to samples remains with the Client. In no event will CTL have any responsibility or liability for the action or inaction of any carrier shipping or delivering any sample to or from CTL's premises. Client is responsible to assure that any sample containing any hazardous substance which is to be delivered to CTL's premises will be packaged, labeled, transported and delivered properly and in accordance with applicable laws.

1.4 Clients using CTL's shipping account(s) do so at their own risk and must purchase separate insurance if they do not wish to assume risk of loss. CTL will not assume any risk whatsoever for any samples outside of CTL's control and not successfully delivered to the laboratory within specified hold times.

1.5 CTL will not accept liability for any sample(s), except sample(s) damaged or broken by log-in staff prior to successful log-in of the sample(s) into the CTL- LIMS system. This includes, but may not be limited to: complete, valid COC documentation, all sample receiving issues being resolved from a delay caused by the Client in CTL's ability to log-in samples, including missed turnaround and hold times, delay in processing and, ultimately, additional charges to the Client.

1.6 CTL will only reject samples per directions from the Client. CTL's sole liability is to inform the Client of any sample receipt issues, and may provide an indication how proceeding with the analysis may affect results and final acceptance by the regulating agency. Ultimately, suitability for use is between the Client and the regulating agency(s).

1.7 Signing of this COC by the Client or Client's representative, or directions to CTL via email or Fax constitutes acceptance of these Terms and Conditions, and guarantees payment by the Client to CTL.

2. PAYMENT TERMS

2.1 Services performed by CTL will be in accordance with prices quoted and later confirmed in writing or as stated in the Price Schedule. Invoices may be submitted to Client upon completion of any sample delivery group. Payment in advance is required for all Clients except those whose credit has been established with CTL. For Clients with approved credit, payment terms are net 30 days from the date of invoice by CTL. All overdue payments are subject to an additional interest and service charge of one and one-half percent (1.5%) or the maximum rate permissible by law, per month or portion thereof from the due date until the date of payment. All fees are charged or billed directly to the Client. The billing of a third party will not be accepted without a statement, signed by the third party that acknowledges and accepts payment responsibility. CTL may suspend work and withhold delivery of data under this order at any time in the event Client fails to make timely payment of its invoices. Client shall be responsible for all costs and expenses of collection including reasonable attorney's fees. CTL reserves the right to refuse to proceed with work at any time based upon an unfavorable Client credit report.

3. CHANGE ORDERS, TERMINATION

3.1 Changes to the Scope of Work, price, or result delivery date may be initiated by CTL after Sample Acceptance due to any condition which conflicts with analytical, QA or other protocols warranted in these Terms and Conditions. CTL will not proceed with such changes until an agreement with the Client is reached on the amount of any cost, schedule change or technical change to the Scope of Work, and such agreement is documented in writing.

3.2 Changes to the Scope of Work, including but not limited to increasing or decreasing the work, changing test and analysis specification or acceleration in the performance of the work may be initiated by the Client after sample acceptance. Such a change will be documented in writing and may result in a change in cost and turnaround time commitment. CTL's acceptance of such changes is contingent upon technical feasibility and operational capacity.

3.3 Suspension or termination of all or any part of the work may be initiated by the Client. CTL will be compensated consistent with Section 2 of these Terms and Conditions. CTL will complete all work in progress and be paid in full for all work completed.

4. WARRANTIES AND LIABILITY

4.1 Where applicable, CTL will use analytical methodologies which are in substantial conformity with published test methods. CTL has implemented these methods in its Laboratory Quality Manuals and referenced Standard Operating Procedures and where the nature or composition of the sample requires it, CTL reserves the right to deviate from these methodologies as necessary or appropriate, based on the reasonable judgment of CTL, which deviations, if any, will be made on a basis consistent with recognized standards of the industry and/or CTL's Laboratory Quality Manuals. Client may request that CTL perform according to a mutually agreed Quality Assurance Project Plan (QAPP). In the event that samples arrive prior to agreement on a QAPP, CTL will proceed with analyses under its standard Quality Manuals then in effect, and CTL will not be responsible for any resampling or other charges if work must be repeated to comply with a subsequently finalized QAPP.

4.2 CTL shall start preparation and/or analysis within holding times provided that Sample Acceptance occurs within 48 hours of sampling or 1/2 of the holding time for the test, whichever is less. Samples received that do not meet this provision will be charged as expedited samples and the appropriate rate will be added accordingly. Where resolution of inconsistencies leading to Sample Acceptance does not occur within this period, CTL will use its best efforts to meet holding times and will proceed with the work provided that, in CTL's judgment, the chain-of-custody or definition of the Scope of Work provide sufficient guidance. Reanalysis of samples to comply with CTL's Quality Manuals will be deemed to have met holding times provided the initial analysis was performed within the applicable holding time. Where reanalysis demonstrates that sample matrix interference is the cause of failure to meet any Quality Manual requirements, the warranty will be deemed to have been met.

4.3 CTL warrants that it possesses and maintains all licenses and certifications which are required to perform services under these Terms and Conditions provided that such requirements are specified in writing to CTL prior to Sample Acceptance. CTL will notify the Client in writing of any decertification or revocation of any license, or notice of either, which affects work in progress.

4.4 The warranty obligations set forth in Sections 4.1, 4.2 and 4.3 are the sole and exclusive warranties given by CTL in connection with any services performed by CTL or any Results generated from such services, and CTL gives and makes NO OTHER REPRESENTATION OR WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. No representative of CTL is authorized to give or make any other representation or warranty or modify this warranty in any way.

4.5 Client's sole and exclusive remedy for the breach of warranty in connection with any services performed by CTL, will be limited to repeating any services performed, contingent on the Client's providing, at the request of CTL and at the Client's expense, additional sample(s) if necessary. Any reanalysis requested by the Client generating Results consistent with the original Results will be at the Client's expense. If resampling is necessary, CTL's liability for resampling costs will be limited to actual cost or one hundred or one hundred fifty dollars ($150) per sample, whichever is less.

4.6 CTL's liability for any and all causes of action arising hereunder, whether based in contract, tort, warranty, negligence or otherwise, shall be limited to the lesser amount of compensation for the services performed or $100,000. All claims, including those for negligence, shall be deemed waived unless suit thereon is filed within one year after CTL's completion of the services. Under no circumstances, whether arising in contract, tort (including negligence), or otherwise, shall CTL be responsible for loss of use, loss of profits, or for any special, indirect, incidental or consequential damages occasioned by the services performed or by application or use of the reports prepared.

4.7 In no event shall CTL have any responsibility or liability to the Client for any failure or delay in performance by CTL which results, directly or indirectly, in whole or in part, from any cause or circumstance beyond the reasonable control of CTL. Such causes and circumstances shall include, but not be limited to, acts of God, acts of Client, acts or orders of any governmental authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, equipment breakdown, matrix interference or unknown highly contaminated samples that impact instrument operation, unavailability of supplies from usual suppliers, difficulties or delays in transportation, mail or delivery services, or any other cause beyond CTL's reasonable control.

5. RESULTS, WORK PRODUCT

5.1 Data or information provided to CTL or generated by services performed under this agreement shall only become the property of the Client upon receipt in full by CTL of payment for the whole Order. Ownership of any analytical method, QA/QC protocols, software programs or equipment developed by CTL for performance of work will be retained by CTL, and Client shall not disclose such information to any third party.

5.2 Data and sample materials provided by Client or at Client's request, and the result obtained by CTL shall be held in confidence (unless such information is generally available to the public or is in the public domain or Client has failed to pay CTL for all services rendered or is otherwise in breach of these Terms and Conditions), subject to any disclosure required by law or legal process.

5.3 Should the Results delivered by CTL be used by the Client or Client's client, even though subsequently determined not to meet the warranties described in these Terms and Conditions, then the compensation will be adjusted based upon mutual agreement. In no case shall the Client unreasonably withhold CTL's right to independently defend its data.

5.4 CTL reserves the right to subcontract services ordered by the Client to another laboratory or laboratories, if, in CTL's sole judgment, it is reasonably necessary, appropriate or advisable to do so, and with the Client's permission. CTL will in no way be liable for any subcontracted services and all applicable warranties, guarantees and insurance are those of the subcontracted laboratory.

5.5 CTL shall dispose of the Client's samples and extracts 30 days after the analytical report is issued, unless instructed to store them for an alternate period of time or to return such samples to the Client, in a manner consistent with U.S. Environmental Protection Agency regulations or other applicable Federal, state or local requirements. Additional charges will apply for samples or extracts stored longer than 30 days at the Clients request. Any samples for projects that are canceled or not accepted, or for which return was requested, will be returned to the Client at Client expense. CTL reserves the right to return to the Client any sample or unused portion of a sample that is not within CTL's permitted capability or the capabilities of CTL's designated waste disposal vendor(s), or will make arrangements to dispose of these samples at Client direction and expense.

5.6 Unless a different time period is agreed to in any order under these Terms and Conditions, CTL agrees to retain all records for five (5) years.

5.7 In the event that CTL is required to respond to legal process related to services for Client, Client agrees to reimburse CTL for hourly charges for personnel involved in the response and attorney fees reasonably incurred in obtaining advice concerning the response, preparation to testify, and appearances related to the legal process, travel and all reasonable expenses associated with the litigation.

6. INSURANCE

6.1 CTL shall maintain in force during the performance of services under these Terms and Conditions, Workers' Compensation and Employer's Liability Insurance in accordance with the laws of the states having jurisdiction over CTL's employees who are engaged in the performance of the work. CTL shall also maintain during such period, Comprehensive General and Contractual Liability (limit of $2,000,000 per occurrence/ aggregate), Comprehensive Automobile Liability, owned and hired, ($1,000,000 combined single limit), and Professional/Pollution Liability Insurance (limit of $5,000,000 per occurrence/aggregate). Any Client required changes to these limits or conditions will result in a change in cost to the Client.

7. AUDIT

7.1 Upon prior notice to CTL, the Client may audit and inspect CTL's records and accounts covering reimbursable costs related to work done for the Client, for a period of one (1) year after completion of the work. The purpose of any such audit shall be only for verification of such costs, and CTL shall not be required to provide access to cost records where prices are expressed as fixed fees or published unit prices.

CT Laboratories Terms and Conditions

Where a purchaser (Client) places an order for laboratory, consulting or sampling services from CT Laboratories (CTL), CTL shall provide the ordered services pursuant to these Terms and Conditions, and the related Quotation, or as agreed in a negotiated contract. In the absence of a written agreement to the contrary, the Order constitutes an acceptance by the Client of CTL's offer to do business under these Terms and Conditions, and an agreement to be bound by these Terms and Conditions. No contrary or additional terms and conditions expressed in a Client's document shall be deemed to become a part of the contract created upon acceptance of these Terms and Conditions, unless accepted by CTL in advance of the start of the project and in writing.

1. ORDERS AND RECEIPT OF SAMPLES (Sample Acceptance Policy)

1.1 The Client may place the Order (i.e., specify a Scope of Work) either by submitting a purchase order to CTL in writing, by telephone (confirmed in writing) or by negotiated contract. Whichever option the Client selects for placing the Order, the Order shall not be valid unless it contains sufficient information to enable CTL to carry out the Client's requirements. It is the policy of CTL that samples not meeting the acceptance criteria, outlined in the NELAC standards and Section 5.8.3.2 of the DOD QSM, will not be accepted by the laboratory or will be qualified on the final report. All samples submitted to the laboratory must: (a) be accompanied by proper, full and complete documentation, including sample identification, location, date and time of collection, the collector's name, type of preservation (if any), type of sample, any special comments concerning the sample and any additional pertinent fields on the chain-of-custody. In the absence of any of the required information, the laboratory will attempt to contact the client to obtain the information; if unable to obtain the necessary information, the final report will be qualified. (b) samples must be labeled appropriately with a unique sample identification written with indelible ink on water resistant labels. If the laboratory cannot determine the identity of a sample, it may be rejected and the client will be contacted for further instructions or resampling. (c) samples must be in an appropriate sample container. If the container is inappropriate, the client will be contacted for further instructions or resampling. If analysis is possible, the final report will be qualified. CTL can provide a sampling guide containing approved containers and preservations for analytical methods requested. (d) adhere to method specified holding times. If samples are received with less than ½ the holding time remaining for the requested test, CTL will make its best effort to analyze the samples and notify the client. If holding times are exceeded, the final report will be qualified. (e) contain adequate sample volume to perform the necessary testing. If sufficient volume is not present, the sample may be rejected and the client will be contacted for further instructions or resampling. If samples show signs of damage, contamination or inadequate preservation, the client will be notified. If analysis can be performed, the final report will be qualified. If not, the samples will be rejected and the client notified for further instructions or resampling. It is the Client's responsibility to understand and package samples correctly and provide the proper amount of temperature control (ice) suitable to current weather conditions.

1.2 CTL must be supplied with complete written disclosure of the known or suspected presence of any hazardous substances, as defined by applicable federal or state law. Where any samples which were not accompanied by the required disclosure, cause interruptions in the lab's ability to process work due to contamination of instruments or work areas, the Client will be responsible for the costs of clean up and recovery.

1.3 Prior to Sample Acceptance, the entire risk of loss or damage to samples remains with the Client. In no event will CTL have any responsibility or liability for the action or inaction of any carrier shipping or delivering any sample to or from CTL's premises. Client is responsible to assure that any sample containing any hazardous substance which is to be delivered to CTL's premises will be packaged, labeled, transported and delivered properly and in accordance with applicable laws.

1.4 Clients using CTL's shipping account(s) do so at their own risk and must purchase separate insurance if they do not wish to assume risk of loss. CTL will not assume any risk whatsoever for any samples outside of CTL's control and not successfully delivered to the laboratory within specified hold times.

1.5 CTL will not accept liability for any sample(s), except sample(s) damaged or broken by log-in staff prior to successful log-in of the sample(s) into the CTL- LIMS system. This includes, but may not be limited to: complete, valid COC documentation, all sample receiving issues being resolved from a delay caused by the Client in CTL's ability to log-in samples, including missed turnaround and hold times, delay in processing and, ultimately, additional charges to the Client.

1.6 CTL will only reject samples per directions from the Client. CTL's sole liability is to inform the Client of any sample receipt issues, and may provide an indication how proceeding with the analysis may affect results and final acceptance by the regulating agency. Ultimately, suitability for use is between the Client and the regulating agency(s).

1.7 Signing of this COC by the Client or Client's representative, or directions to CTL via email or Fax constitutes acceptance of these Terms and Conditions, and guarantees payment by the Client to CTL.

2. PAYMENT TERMS

2.1 Services performed by CTL will be in accordance with prices quoted and later confirmed in writing or as stated in the Price Schedule. Invoices may be submitted to Client upon completion of any sample delivery group. Payment in advance is required for all Clients except those whose credit has been established with CTL. For Clients with approved credit, payment terms are net 30 days from the date of invoice by CTL. All overdue payments are subject to an additional interest and service charge of one and one-half percent (1.5%) or the maximum rate permissible by law, per month or portion thereof from the due date until the date of payment. All fees are charged or billed directly to the Client. The billing of a third party will not be accepted without a statement, signed by the third party that acknowledges and accepts payment responsibility. CTL may suspend work and withhold delivery of data under this order at any time in the event Client fails to make timely payment of its invoices. Client shall be responsible for all costs and expenses of collection including reasonable attorney's fees. CTL reserves the right to refuse to proceed with work at any time based upon an unfavorable Client credit report.

3. CHANGE ORDERS, TERMINATION

3.1 Changes to the Scope of Work, price, or result delivery date may be initiated by CTL after Sample Acceptance due to any condition which conflicts with analytical, QA or other protocols warranted in these Terms and Conditions. CTL will not proceed with such changes until an agreement with the Client is reached on the amount of any cost, schedule change or technical change to the Scope of Work, and such agreement is documented in writing.

3.2 Changes to the Scope of Work, including but not limited to increasing or decreasing the work, changing test and analysis specification or acceleration in the performance of the work may be initiated by the Client after sample acceptance. Such a change will be documented in writing and may result in a change in cost and turnaround time commitment. CTL's acceptance of such changes is contingent upon technical feasibility and operational capacity.

3.3 Suspension or termination of all or any part of the work may be initiated by the Client. CTL will be compensated consistent with Section 2 of these Terms and Conditions. CTL will complete all work in progress and be paid in full for all work completed.

4. WARRANTIES AND LIABILITY

4.1 Where applicable, CTL will use analytical methodologies which are in substantial conformity with published test methods. CTL has implemented these methods in its Laboratory Quality Manuals and referenced Standard Operating Procedures and where the nature or composition of the sample requires it, CTL reserves the right to deviate from these methodologies as necessary or appropriate, based on the reasonable judgment of CTL, which deviations, if any, will be made on a basis consistent with recognized standards of the industry and/or CTL's Laboratory Quality Manuals. Client may request that CTL perform according to a mutually agreed Quality Assurance Project Plan (QAPP). In the event that samples arrive prior to agreement on a QAPP, CTL will proceed with analyses under its standard Quality Manuals then in effect, and CTL will not be responsible for any resampling or other charges if work must be repeated to comply with a subsequently finalized QAPP.

4.2 CTL shall start preparation and/or analysis within holding times provided that Sample Acceptance occurs within 48 hours of sampling or 1/2 of the holding time for the test, whichever is less. Samples received that do not meet this provision will be charged as expedited samples and the appropriate rate will be added accordingly. Where resolution of inconsistencies leading to Sample Acceptance does not occur within this period, CTL will use its best efforts to meet holding times and will proceed with the work provided that, in CTL's judgment, the chain-of-custody or definition of the Scope of Work provide sufficient guidance. Reanalysis of samples to comply with CTL's Quality Manuals will be deemed to have met holding times provided the initial analysis was performed within the applicable holding time. Where reanalysis demonstrates that sample matrix interference is the cause of failure to meet any Quality Manual requirements, the warranty will be deemed to have been met.

4.3 CTL warrants that it possesses and maintains all licenses and certifications which are required to perform services under these Terms and Conditions provided that such requirements are specified in writing to CTL prior to Sample Acceptance. CTL will notify the Client in writing of any decertification or revocation of any license, or notice of either, which affects work in progress.

4.4 The warranty obligations set forth in Sections 4.1, 4.2 and 4.3 are the sole and exclusive warranties given by CTL in connection with any services performed by CTL or any Results generated from such services, and CTL gives and makes NO OTHER REPRESENTATION OR WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. No representative of CTL is authorized to give or make any other representation or warranty or modify this warranty in any way.

4.5 Client's sole and exclusive remedy for the breach of warranty in connection with any services performed by CTL, will be limited to repeating any services performed, contingent on the Client's providing, at the request of CTL and at the Client's expense, additional sample(s) if necessary. Any reanalysis requested by the Client generating Results consistent with the original Results will be at the Client's expense. If resampling is necessary, CTL's liability for resampling costs will be limited to actual cost or one hundred or one hundred fifty dollars ($150) per sample, whichever is less.

4.6 CTL's liability for any and all causes of action arising hereunder, whether based in contract, tort, warranty, negligence or otherwise, shall be limited to the lesser amount of compensation for the services performed or $100,000. All claims, including those for negligence, shall be deemed waived unless suit thereon is filed within one year after CTL's completion of the services. Under no circumstances, whether arising in contract, tort (including negligence), or otherwise, shall CTL be responsible for loss of use, loss of profits, or for any special, indirect, incidental or consequential damages occasioned by the services performed or by application or use of the reports prepared.

4.7 In no event shall CTL have any responsibility or liability to the Client for any failure or delay in performance by CTL which results, directly or indirectly, in whole or in part, from any cause or circumstance beyond the reasonable control of CTL. Such causes and circumstances shall include, but not be limited to, acts of God, acts of Client, acts or orders of any governmental authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, equipment breakdown, matrix interference or unknown highly contaminated samples that impact instrument operation, unavailability of supplies from usual suppliers, difficulties or delays in transportation, mail or delivery services, or any other cause beyond CTL's reasonable control.

5. RESULTS, WORK PRODUCT

5.1 Data or information provided to CTL or generated by services performed under this agreement shall only become the property of the Client upon receipt in full by CTL of payment for the whole Order. Ownership of any analytical method, QA/QC protocols, software programs or equipment developed by CTL for performance of work will be retained by CTL, and Client shall not disclose such information to any third party.

5.2 Data and sample materials provided by Client or at Client's request, and the result obtained by CTL shall be held in confidence (unless such information is generally available to the public or is in the public domain or Client has failed to pay CTL for all services rendered or is otherwise in breach of these Terms and Conditions), subject to any disclosure required by law or legal process.

5.3 Should the Results delivered by CTL be used by the Client or Client's client, even though subsequently determined not to meet the warranties described in these Terms and Conditions, then the compensation will be adjusted based upon mutual agreement. In no case shall the Client unreasonably withhold CTL's right to independently defend its data.

5.4 CTL reserves the right to subcontract services ordered by the Client to another laboratory or laboratories, if, in CTL's sole judgment, it is reasonably necessary, appropriate or advisable to do so, and with the Client's permission. CTL will in no way be liable for any subcontracted services and all applicable warranties, guarantees and insurance are those of the subcontracted laboratory.

5.5 CTL shall dispose of the Client's samples and extracts 30 days after the analytical report is issued, unless instructed to store them for an alternate period of time or to return such samples to the Client, in a manner consistent with U.S. Environmental Protection Agency regulations or other applicable Federal, state or local requirements. Additional charges will apply for samples or extracts stored longer than 30 days at the Clients request. Any samples for projects that are canceled or not accepted, or for which return was requested, will be returned to the Client at Client expense. CTL reserves the right to return to the Client any sample or unused portion of a sample that is not within CTL's permitted capability or the capabilities of CTL's designated waste disposal vendor(s), or will make arrangements to dispose of these samples at Client direction and expense.

5.6 Unless a different time period is agreed to in any order under these Terms and Conditions, CTL agrees to retain all records for five (5) years.

5.7 In the event that CTL is required to respond to legal process related to services for Client, Client agrees to reimburse CTL for hourly charges for personnel involved in the response and attorney fees reasonably incurred in obtaining advice concerning the response, preparation to testify, and appearances related to the legal process, travel and all reasonable expenses associated with the litigation.

6. INSURANCE

6.1 CTL shall maintain in force during the performance of services under these Terms and Conditions, Workers' Compensation and Employer's Liability Insurance in accordance with the laws of the states having jurisdiction over CTL's employees who are engaged in the performance of the work. CTL shall also maintain during such period, Comprehensive General and Contractual Liability (limit of $2,000,000 per occurrence/ aggregate). Comprehensive Automobile Liability, owned and hired, ($1,000,000 combined single limit), and Professional/Pollution Liability Insurance (limit of $5,000,000 per occurrence/aggregate). Any Client required changes to these limits or conditions will result in a change in cost to the Client.

7. AUDIT

7.1 Upon prior notice to CTL, the Client may audit and inspect CTL's records and accounts covering reimbursable costs related to work done for the Client, for a period of one (1) year after completion of the work. The purpose of any such audit shall be only for verification of such costs, and CTL shall not be required to provide access to cost records where prices are expressed as fixed fees or published unit prices.

"Based on the Method Blank and LCS QC data provided and justification for switching from use of a Teflon-Coated Ball Mill to using a Puck Mill to process the Curtis Bay RI/FS ISM Soil Samples, I find the request for the change to the sample prep to be acceptable. I have a more detailed response in the form of an MFR which I have attached as a file to this email response."

Subject: [Non-DoD Source] Sample preparation for the Curtis Bay Depot

All,

ERT has contracted CT Laboratories, LLC (CT) to perform the sample preparation and analysis required for the Curtis Bay Ordnance Depot arsenic and manganese RI. After reviewing the Final UFP-QAPP, CT is concerned with processing the sample mass that will be submitted for each of the ISM soil samples collected (approximately 5-10 kg) using the Teflon-coated ball mill specified in the UFP-QAPP. CT indicates that they can process three 1-2 kg masses of soil at a time using the Teflon-coated ball mill. Each of these grind processes will take from 20-30 minutes for clay, and up to one week for sand. Soil samples collected for the RI are expected to be a mixture of sands and clays. Given the large number of soil samples that will be submitted (220+ [surface, subsurface, and QC replicates]) and the need to divide the samples into 5-10 processing masses, the sample processing using the Teflon-coated ball mill is impracticable.

In order to process the soil samples collected at the Curtis Bay Ordnance Depot, ERT and CT propose use of the puck mill for sample grinding. The puck mill is expected to grind the soil samples to the required specification in one minute or less. Use of the puck mill for soil sample grinding will allow the laboratory to process and analyze the submitted soil samples so that the project schedule is not impacted.

To validate use of the puck mill grinding method, CT performed a puck mill grind test on method blank sand materials, both as a blank and arsenic and manganese spiked laboratory control samples and analyzed all for arsenic and manganese using USEPA Method SW846 6010C with the following results:

Puck Mill Grind Test for Analytical Method SW846 6010C (one minute grind time)

The concern with use of the puck mill with soil sample submitted for analysis of manganese is adding a high bias to the sample results due to the metals makeup of the puck mill. Although low levels of manganese are detected in the method blank sample, these low levels are not expected to affect project decisions due to the magnitude of the lowest screening level (300 mg/kg, USEPA BTAG) as compared to the detected concentration in the method blank. Also note that all but one LCS recovery was within the DoD QSM QC limit.

The concern with use of the puck mill with soil sample submitted for analysis of arsenic is adding a low bias to the sample results due to volatilization of arsenic during the grinding process. Based on the LCS recoveries (all recoveries were within the DoD QSM QC limit) for arsenic, use of the puck mill for a one-minute grind cycle is not expected to adversely affect the concentrations measured in site soil samples.

Please let me know if sample preparation using the puck mill will be acceptable.

Thank you,

Memorandum for Record

Subject: Response to Email Message, sent 11 March 2019 from ERT on Sample Preparation on the Curtis Bay Depot RI/FS Project for Mn and As to change from processing of ISM Soil Samples from using a Teflon-Coated Ball Mill to a Puck Mill

Your request to use the puck mill for soil sample grinding in order to more efficiently process the large volume and quantities of soil samples consisting of a clay and sand mix is acceptable based on the method QC data provide for the 10 replicate method blanks and the LCS samples processed using the puck mill and analyzed for arsenic and manganese.

Based on an evaluation of the listed Measurement Performance Criteria (MPC) for the two metals in QAPP Worksheet #12, the method blank result for manganese needs to be < 1/10 the regulatory limit (or < 1/10th the amount measure in any sample [whichever is greater] per the DoD QSM). Between the writing of the Draft QAPP and then the Final version of the QAPP, two additional regulatory criteria were added to Worksheet #15: the USEPA Residential and the USEPA BTAG, with the BTAG regulatory value for Mn being the lowest at 330 mg/kg. A tenth of that value is 33 mg/kg, therefore any Method Blank analysis needs to be < 33 mg/kg for Mn. The Method Blank results presented for Mn range from 2.8 to 4.5 mg/kg which is a factor of 7x below 1/10th the Regulatory Limit. Also 9 of the 10 LCS samples spiked for Mn were within acceptable percent recovery limits with the one falling outside the QC limit at 80% which was slightly below the 85% Lower Limit.

For the Arsenic analysis, using the puck mill with a limit of a one-minute grind cycle is acceptable to prevent the puck mill from getting too hot. If another grinding cycle will be done, several minutes should be allowed for the puck mill to cool down. The puck mill should not contain arsenic as part of its elemental makeup, so that shouldn't be a contributing factor in the method blank analysis. The lowest regulatory action level listed for Arsenic in QAPP Worksheet #15 is 0.68 mg/kg, the EPA Residential value. Based on the reported method blank results, the values for arsenic are below the EPA Residential Action Limit or are non-detect.

Case Narrative

Client: ERT, Inc.
Project: Former Curtis Bay Ordnance Depot – Arsenic & Manganese RI/FS; Anne Arundel County, MD
Sample Receipt Dates: 03/19/2019, 03/21/2019, & 03/22/2019
SDG #: 143587 (Folders 143587, 143688, & 143730)

Forty ISM samples were received and analyzed for Arsenic and Manganese. Prior to analysis, the ISM samples were dried, sieved, and ground following the homogenization procedure outlined by the client. The assigned sample ID number, date sampled, and date received are indicated in the attached Project Summary. The samples were received intact and at a temperature within method specified acceptance limits. A breakdown of sample receipt information can be found on the Sample Condition Report located in the last section of the data package and any exceptions are noted below. The analyses were performed following DOD QSM 5.

Manual integrations have been performed on the data provided with this package. If manual integrations were performed, a Reason #(s) was included on the raw data that corresponds to the "Index Key for Manual Integration Rationale". The raw data includes a "Before" and "After" manual integration illustration. The manual integrations were initialed and dated by the analyst, as well as, by the person reviewing the data.

Sample Analysis and Quality Control

Metals Analysis:

The samples were analyzed using US EPA Method 6010C (ICP Metals). All samples were analyzed within the holding time. The following summaries of quality control procedures are included:

Initial and Continuing Calibration Verification
Blanks Summary
ICP Interference Check Data
Spike Sample Recovery
Duplicates Data
Laboratory Control Sample Data
Analysis Run Log

ICP Arsenic & Manganese (6010C) Soil Analysis

Continuing Calibration Verification (CCV) standards were analyzed at two levels (CCV1 & CCV2) with potentially differing wavelengths. Data associated with CCV's were evaluated based on the concentration of the element in the samples and compared to the appropriate CCV level/wavelength.

Some samples may have been analyzed and/or reanalyzed diluted to obtain results for all target analytes within the calibration range of the instrument.

Analytical Run # 159095

Arsenic was detected in the Method Blank (MB) greater than the Method Detection Limit (MDL) but less than ½ the Reporting Limit (RL). The samples were reported and not qualified because the MB arsenic result was less than 1/10th of the sample results.

Manganese was detected in the MB above the MDL and greater than ½ the RL. The samples were reported and not reanalyzed because the MB manganese result was less than 1/10th of the sample results.

The Serial Dilution (L) for sample # 253258 was not applicable for arsenic because the parent sample raw result was less than 50 times the Limit of Quantitation (LOQ). A Post Digestion Spike (PDS) was analyzed and was acceptable for arsenic. The parent sample was reported and not qualified.

The L for sample # 253258 was not acceptable for manganese because the result exceeded the Relative Percent Difference (RPD) limit. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

The Matrix Spike (MS) and Matrix Spike Duplicate (MSD) for sample # 253258 had outside recoveries for arsenic and manganese. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

Analytical Run # 159293

Arsenic was detected in the MB greater than the MDL but less than ½ the RL. The samples were reported and not qualified because the MB arsenic result was less than 1/10th of the sample results.

Manganese was detected in the MB above the MDL and greater than ½ the RL. The samples were reported and qualified with a "B" flag when the MB manganese result was greater than 1/10th of the sample results.

The L for sample # 254964 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was acceptable for arsenic. The parent sample was reported and not qualified.

The L for sample # 254964 was not acceptable for manganese because the result exceeded the RPD limit. A PDS was analyzed and was acceptable. The parent sample was reported and not qualified.

The L for sample # 254965 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was acceptable for arsenic. The parent sample was reported and not qualified.

The L for sample # 254965 was not acceptable for manganese because the result exceeded the RPD limit. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

The Duplicate (DUP) for sample # 254965 was not acceptable for manganese because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The MS and MSD for sample # 254965 had outside recoveries for manganese. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

Analytical Run # 159294

Arsenic was detected in the MB greater than the MDL but less than ½ the RL. The samples were reported and qualified with a "B" flag when the MB arsenic result was greater than 1/10th of the sample results.

Manganese was detected in the MB above the MDL and greater than ½ the RL. The samples were reported and not qualified because the MB manganese result was less than 1/10th of the sample results.

The DUP for sample # 254600 was not acceptable for arsenic because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The Triplicate (TRIP) for sample # 254600 was not applicable for arsenic because the parent sample results were less than five times the LOQ. The parent sample was reported and qualified with a "Y" flag for the failing DUP.

The DUP for sample # 254965 was not acceptable for manganese because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The L for sample # 254601 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was unacceptable for arsenic. The parent sample was reported and qualified with an "M" flag for the failing element.

The L for sample # 254601 was not acceptable for manganese because the result exceeded the RPD limit. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.
The DUP for sample # 254601 was not acceptable for arsenic because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The MS and MSD for sample # 254601 had outside recoveries for manganese. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

The L for sample # 254602 was not applicable for arsenic because the parent sample raw result was less than 50 times the LOQ. A PDS was analyzed and was acceptable for arsenic. The parent sample was reported and not qualified.

The L for sample # 254602 was not acceptable for manganese because the result exceeded the RPD limit. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

The DUP for sample # 254602 was not acceptable for manganese because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The TRIP for sample # 254602 was not acceptable for manganese because the result exceeded the RPD limit. The parent sample was reported and qualified with a "Y" flag for the failing element.

The MS and MSD for sample # 254602 had outside recoveries for manganese. A PDS was analyzed and was unacceptable for manganese. The parent sample was reported and qualified with an "M" flag for the failing element.

CT LABORATORIES

Data Qualifiers

Code	Description
A	Analyte averaged calibration criteria within acceptable limits.
B	Analyte detected in associated Method Blank.
C	Toxicity present in BOD sample.
D	Diluted Out.
E	Safe, No Total Coliform detected.
F	Unsafe, Total Coliform detected, no E. Coli detected.
G	Unsafe, Total Coliform detected and E. Coli detected.
H	Holding time exceeded.
J	Estimated value.
L	Significant peaks were detected outside the chromatographic window.
M	Matrix spike and/or Matrix Spike Duplicate recovery outside acceptance limits.
N	Insufficient BOD oxygen depletion.
O	Complete BOD oxygen depletion.
P	Concentration of analyte differs more than 40% between primary and confirmation analysis.
Q	Laboratory Control Sample outside acceptance limits.
R	See Narrative at end of report.
S	Surrogate standard recovery outside acceptance limits due to apparent matrix effects.
T	Sample received with improper preservation or temperature.
U	Analyte concentration was not above the detection level.
V	Raised Quantitation or Reporting Limit due to limited sample amount or dilution for matrix background interference.
W	Sample amount received was below program minimum.
X	Analyte exceeded calibration range.
Y	Replicate/Duplicate precision outside acceptance limits.
Z	Calibration criteria exceeded.

CT LABORATORIES

MANUAL INTEGRATION REASON CODES

CTLaboratories has identified four general cases with valid reasons supporting the use of manual integration techniques. These codes are used on chromatograms in this data package to document the reasons for manual integrations per CTLaboratories' SOP SS-10 current revision.

#1: **Data system failed to select the correct peak or missed the peak entirely.**
In some cases the chromatography system selects and integrates the "wrong peak". In this case the analyst must correct the selection and force the system to integrate the proper peak. In other instances the system may miss the peak completely. In this case the analyst manually integrated the peak

#2: **Data System Splits the Peak Incorrectly or Integrates a False Peak as a Rider Peak.**
This phenomenon is common at low concentrations where the signal to noise ratio is low. A single compound (peak) is incorrectly split into multiple peaks or integrated as a main peak with one or more rider peaks resulting in low or high area counts for the target compound.

#3: Improperly Integrated Isomers and/or coeluting compounds.
For when the system fails to distinguish coeluting compounds and or isomers. The integration areas and concentrations may be inaccurate, and they must be corrected by manual integration. Prime examples are compounds that are unresolved and integrated improperly when present at low concentrations in standards or samples.

#4: System Established Incorrect Baseline.
There are numerous situations in chromatography where the system establishes the baseline incorrectly. Some baseline errors will be obvious to the analyst and may be corrected via manual procedures.

#5: Miscellaneous.
Some situations involving integration errors may require in-depth review and technical judgment. These cases should be brought to the attention of the group supervisor. If the form of manual integration is not clearly covered by these four cases, then review and approval by the group supervisor or the *QA/QC* Supervisor will be required.
